

# Elliptic Partial Differential Equations

Lecture by Ivan Moyano

Lent 2019, typed by Jiwoon Park

Elliptic PDEs (24 lectures, 4 example sheets).

Example class : given by Fritz Hiesmayr, at week 3, 5, 7 and one at next term

Specific information would be given at the lecturer's website. Also handwritten lecture notes and example sheets would be uploaded.

Main reference would be [1]. 2nd reference would be the [2]. Also [3] covers some materials that are not done in the other two.

---

(17th January, Thursday)

In Analysis of PDEs, we proved existence of solution and regularity for equations of form

$$Lu + \begin{cases} \partial_t u \\ \partial_t^2 u \\ i\partial_t u \\ 0 \end{cases} = f \quad \text{in an appropriate domain and given some boundary condition}$$

where  $Lu = \sum_{i,j} \partial_i(a^{ij}(x)\partial_j u) + \sum_j b_j(x)\partial_j u + c(x)u$ .

We usually assumed  $L$  is uniformly elliptic, *i.e.*  $\exists C > 0$  such that  $a^{ij}(x)\xi_i\xi_j \geq C|\xi|^2$  for any  $\xi \in \mathbb{R}^d$ ,  $x \in \Omega$ .

We Say  $L$  is elliptic if the constant  $C$  above in fact depends on  $x$ .

## Lax-Milgram theory

To prove uniqueness and existence of solution of elliptic PDEs, we used *Lax-Milgram theorem*, which leads us to use *variational methods (or energy methods)* in Hilbert space  $L^2(\Omega)$ . Recall, we  $u$  is a weak solution of  $Lu = f$ ,  $u|_{\partial\Omega} = g$  if  $B[u, v] = \langle f, v \rangle$  for all  $v \in H^s(\Omega)$ , together with given boundary condition (in the sense of traces). Then we proved regularity results of the solution  $Lu = f \in L^2(\Omega)$ , for example  $u \in H^1(\Omega) \cap H^2(\Omega)$ , given  $a, b, c$  sufficiently smooth, which was a result of energy estimate

$$\|u\|_{H^2} \leq C\|f\|_{L^2}$$

## Potential theory

But what have people done before *Lax-Milgram*? For a simple example, consider the Dirichlet problem for  $\Delta$  on  $\Omega$ . That is given  $f \in C^0(\Omega)$ ,  $g \in C^0(\partial\Omega)$ , we want to find  $u \in C^2(\Omega) \cap C^0(\overline{\Omega})$  such that

$$\begin{aligned} -\Delta u &= f & \text{in } \Omega \\ u &= g & \text{on } \partial\Omega \end{aligned}$$

Recall, Lax-Milgram theorem uses Riesz representation theorem which does not give the explicit formula for the solution of the problem. Instead, we would like to have explicit solution of the form

$$u(x) = \int_{\Omega} K(x, t) f(y) dy + \int_{\partial\Omega} \tilde{K}(x, t) g(w) dS_w$$

This is in fact achievable when  $\Omega$  is a ball, a half space, or the whole  $\mathbb{R}^d$  (provided we have well-behaved asymptotic condition, given in terms of the **fundamental solutions**).

**Definition)**  $E \in C^\infty(\mathbb{R}^d \setminus \{0\})$  satisfying

$$\begin{aligned} -\Delta E &= \delta_0 & \text{in } \mathbb{R}^d \\ E &\rightarrow 0 & \text{as } |x| \rightarrow \infty \end{aligned}$$

in sense of distribution is called the **fundamental solution**.

- In the case  $d = 1$ ,  $E(x) = \frac{1}{2}|x|$  for  $x \in \mathbb{R}$  (although this does not go to 0 as  $|x| \rightarrow \infty$ ). This can be checked by  $-\partial_x^2 E(x) = 0$  for  $x \neq 0$  and  $-\langle E, \partial_x^2 \phi \rangle = \phi(0)$  for all  $\phi \in C_c^\infty(\mathbb{R})$ . If we let  $u = E * f = \int E(x - y) f(y) dy$ , then  $-\Delta u = f \in C_c^\infty(\mathbb{R})$ ,  $u \rightarrow 0$  as  $|x| \rightarrow \infty$ .
- In the case  $d = 2$ ,  $E = \frac{1}{2\pi} \log |x|$ .
- In the case  $d \geq 3$ ,  $E(x) = c_d \frac{1}{|x|^{d-2}}$ . This is just the Newtonian potential.

The potential theory is completely different from Lax-Milgram theory, and is at the same time useful in a different sense. The potential theory would be used in *1st Schauder theory*, which provides the regularity results in Hölder spaces.

### 1st step. Schauder theory

Let  $Lu = f \in C^{0,\alpha}$ ,  $u|_{\partial\Omega} = g \in C^0(\partial\Omega)$ . Then we have  $u \in C^{2,\alpha}(\Omega) \cap C^0(\overline{\Omega})$ . We will examine  $\|u\|_{C^{0,\alpha}} = \inf_{x,y} \frac{|u(x) - u(y)|}{|x - y|^\alpha}$ . This uses classical potential theory (Perrons' method). This has link to the theory of Harmonic functions (e.g. maximal principle) and probability theory.

### 2nd step. Extend Schauder theory of $L$ not close to $-\Delta$

This theory was developed by De Giorgi and Nash, Mozer. (Oscillations of the solution, i.e.  $\inf_{B_R} |u(x) - u(y)| \leq CR^\alpha$ ).

### 3rd step. $L^p$ theory - Calderon & Zygmund

Later, would choose you preferences :

- Spectral theory for  $-\Delta + v(x)$  in  $\mathbb{R}^d$

- Nonlinear PDEs, e.g. Minimal surface (related to differential geometry), Monge-Ampère (related to optimal transport theory)
- hypoellipticity, on domain  $\Omega = \mathbb{R}_x^d \times \mathbb{R}_v^d$ , with operator  $\mathcal{K} = v \cdot \nabla_x - \Delta_x$ .
- Minimization of functionals, Euler-Lagrange equation for

$$\min_{u \in H^p(\Omega)} \int_{\Omega} F(u, \nabla u, \nabla^2 u) dx$$

(19th January, Saturday)

## Perron's methods

Let  $\Omega \subset \mathbb{R}^d$  be an open bounded connected set.

**Definition** (*Regular Points*)  $\xi \in \partial\Omega$  is **regular** if  $\exists$  *barrier function* at  $\xi$ . That is, a function  $w \in C^0(\overline{\Omega})$  such that  $\Delta w \leq 0$ ,  $w > 0$  in  $\Omega \setminus \{\xi\}$ , and  $w(\xi) = 0$ .

**Theorem** (*Perron*) Let  $\varphi \in C^0(\partial\Omega)$  and consider the Dirichlet problem  $-\Delta u = 0$  in  $\Omega$  and  $u = \varphi$  on  $\partial\Omega$ . Then

- (1) The classical Dirichlet problem has a unique solution  $u \in C^2(\Omega)$  if  $\partial\Omega$  *regular*.
- (2) If Dirichlet problem is solvable for all  $\varphi$ , then  $\partial\Omega$  is *regular*.

**Definition** (*subharmonic, superharmonic*) A function  $u \in C^2(\Omega) \cap C^0(\overline{\Omega})$  is **sub**(resp. **super**)**harmonic** if  $\Delta u \geq 0$ (resp.  $\Delta u \leq 0$ ) in  $\Omega$ .

**Mean value inequality**) Let  $u \in C^2(\Omega) \cap C^0(\overline{\Omega})$  be a harmonic function in  $\Omega$ . Then  $\forall x_0 \in \Omega$ ,  $\forall R > 0$  such that  $B(x_0, R) \subset \Omega$ , one has

$$u(x_0) = \frac{1}{d\omega_d R^{d-1}} \int_{\partial B(x_0, R)} u(x) dS_x = \frac{1}{\omega_d R^d} \int_{B(x_0, R)} u(x) dx$$

where  $w_d = \text{vol}(B_1)$  and  $dw_{d-1} = \text{vol}(\partial B_1)$ .

If  $u$  is a sub/superharmonic function, then the equality is replaced by  $\leq$  or  $\geq$ .

**proof**) By divergence theorem, we have, for any  $\rho \in (0, R)$ ,

$$0 = \int_{B(x_0, \rho)} \text{div}(\nabla u) dx = \int_{\partial B(x_0, \rho)} \nabla u \cdot n_x dS_x$$

where  $n_x$  is the normal vector heading outside at point  $x \in \partial B(x_0, \rho)$ . On the other hand,

$$\begin{aligned} \int_{\partial B(x_0, \rho)} \nabla u(x) \cdot n_x dS_x &= \rho^{d-1} \int_{w \in S^{d-1}} \frac{d}{dr} u(x_0 + rw) \Big|_{r=\rho} dS(w) = \rho^{d-1} \frac{d}{d\rho} \int_{S^{d-1}} u(x_0 + \rho w) dS(w) \\ &= \rho^{d-1} \frac{d}{d\rho} \left[ \frac{1}{\rho^{d-1}} \int_{\partial B(x_0, \rho)} u(x) dS_x \right] \end{aligned}$$

so the value of  $\frac{1}{\rho^{d-1}} \int_{\partial B(x_0, \rho)} u(x) dS_x$  stays constant as  $\rho$  varies. Letting  $\rho \rightarrow R$ , one has

$$\rho^{1-d} \int_{\partial B_\rho} u(x) dS_x = R^{1-d} \int_{\partial B_R} u(s) dS_x$$

and as  $\rho \rightarrow 0^+$ , one has

$$\rho^{1-d} \int_{\partial B_\rho} u(x) dx \xrightarrow{\rho \rightarrow 0^+} u(x_0) w_d d$$

and therefore we have the result for the harmonic case.

The subharmonic and the superharmonic cases follow from the same method.

(End of proof)  $\square$

**Corollary 1)** (*Maximum principle*) If  $u$  is subharmonic, then  $\sup_{\overline{B_R}} u = \sup_{\partial B_R} u$ , and if  $u$  is superharmonic, then  $\inf_{\overline{B_R}} u = \inf_{\partial B_R} u$ .

**Corollary 2)** (*Strong maximum principle*) Let  $u$  be sub(resp. super)harmonic in  $\Omega$ . Assume  $\exists x_0 \in \Omega$  such that  $\max_{\overline{\Omega}} u = u(x_0) = M$  (resp.  $\min_{\overline{\Omega}} u = u(x_0)$ ). Then  $u = \text{constant}$ .

**proof)** In the case  $\Delta u \geq 0$ , let  $\Omega_M = \{x \in \Omega : u(x) = M\}$ , which is a non-empty closed set. We have for each  $\zeta \in \Omega_M$ ,  $R > 0$  such that  $B(\zeta, R) \subset \Omega$ . Since  $u - M$  is also a subharmonic function, we have

$$u(\zeta) - M \leq C_d \int_{\partial B_R} (u - M) dS_x \leq 0$$

where the last inequality follows from the assumption that  $M = \max_{\overline{\Omega}} u$ . Therefore  $u(x) = M$  for any  $x \in B_R$ , and so  $\Omega_M$  also open. Hence  $\Omega_M = \Omega$  as  $\Omega$  is connected.

(End of proof)  $\square$

**Definition)** Let  $u \in C^0(\Omega)$  (not necessarily  $C^2$ ). Then  $u$  is **subharmonic function** in  $\Omega$  if  $\forall B \subset \Omega$ ,  $\forall h$  harmonic function, such that  $u \leq h$  on  $\partial B_R$  implies  $u \leq h$  in  $B_R$ .

**Lemma)** Let  $u_1, u_2$  be subharmonic functions. Then  $\max(u_1, u_2)$  is subharmonic.

Now come back to the Dirichlet problem in the ball  $B = B(0, R)$ ,

$$\begin{cases} \Delta u = 0 & \text{in } B \\ u = \varphi & \text{on } \partial B \end{cases} \quad \dots\dots\dots (D)$$

**Theorem)** For all  $\varphi \in C^0(\partial B)$ ,

$$u(x) = \begin{cases} \int_{\partial B} \frac{R^2 - |x|^2}{dw_d R} \frac{\varphi(y)}{|x-y|^d} dS_y & , x \in B \\ \varphi(x), & x \in \partial B \end{cases}$$

is  $C^2(B) \cap C^0(\overline{B})$  and satisfies the Dirichlet problem (D).

**proof)** The fact that  $\Delta u = 0$  in the interior of  $B$  comes from basic calculus. So we just have to check that for each  $x_0 \in \partial B$ , we have  $u(x) \rightarrow \varphi(x_0)$  as  $x \rightarrow x_0$ .

Define the integral kernel as  $k(x, y) = \frac{R^2 - |x|^2}{dw_d R} \frac{1}{|x-y|^d}$ , then we have  $u(x) = \int k(x, y) \varphi(y) dS_y$  and  $\int_{\partial B} k(x, y) dS_y = 1$  for each  $x \in B$ . The idea is that, when  $x$  is sufficiently close to  $x_0$ , then the integral of the kernel near  $x_0$  dominates the whole integral. Pick  $\delta > 0$  such that  $|\varphi(x) - \varphi(x_0)| < \epsilon$  whenever  $|x_0 - x| < \delta$ .

$$|u(x) - \varphi(x_0)| \leq \left| \int_{|y-x_0|>\delta} \frac{R^2 - |x|^2}{dw_d R} \frac{\varphi(y) - \varphi(x_0)}{|x-y|^d} dS_y \right| + \left| \int_{|y-x_0|\leq\delta} k(x, y) (\varphi(y) - \varphi(x_0)) dS_y \right|$$

The first term is dominated by  $2M(R^2 - |x|^2)\delta^{-d}/dw_dR \rightarrow 0$  as  $|x| \rightarrow R$ , and using the fact that  $\int k(x, y)dy$ , the second term is smaller than  $\epsilon$ , so for sufficiently small  $\delta$ , we can make bound  $|u(x) - \varphi(x_0)| < 2\epsilon$ .

(End of proof)  $\square$

### Interior estimate for derivatives

Let  $u$  be a harmonic function on  $\Omega$  and  $B(x, r) \subset \Omega$ . Then by divergence theorem,

$$\begin{aligned} |\nabla u(x)| &= \frac{1}{w_d r^d} \int_{B(x, r)} \nabla u(y) dy \\ &= \frac{1}{w_d r^d} \int_{\partial B(x, r)} u(y) n_y dS_y \end{aligned}$$

and therefore we may estimate  $|\nabla u(x)|$  in terms of  $u$ .

$$|\nabla u(x)| \leq \frac{c}{\text{dist}(x, \partial\Omega)} \max_{\bar{B}} |u|$$

(22nd January, Tuesday)

**Theorem 2.9)** (*Interior estimates for harmonic functions*) Let  $\Delta u = 0$  in  $\Omega$ . Let  $\Omega' \subset \Omega$  compact. Then  $\forall \alpha \in \mathbb{N}^d$ ,

$$\sup_{\Omega} |\partial^\alpha u| \leq \left( \frac{|\alpha|d}{\text{dist}(\Omega', \partial\Omega)} \right)^{|\alpha|} \sup_{\Omega} |u|$$

**Fact :** (Exercise)  $\Delta u = 0$  implies  $u \in C^\infty(\Omega)$  and  $u$  real analytic.

**proof)**  $\Delta(\partial_{x_i} u) = \partial_{x_i} \Delta u = 0$  in  $\Omega^1$  harmonic, then mean-value theorem states that

$$\partial_{x_i} u(y) = \frac{1}{w_d R^d} \int_{B(y, R)} \partial_{x_i} u dx = \frac{1}{w_d R^d} \int_{\partial B(y, R)} u(x) (n_x \cdot e_i) dx$$

where  $|w_d| = |B(0, 1)|$ . Then

$$\begin{aligned} \max_{i=1, \dots, d} |\partial_{x_j} u(y)| &\leq \frac{1}{w_d R^d} \sup_{\Omega} |u| |\partial B(y, R)| \\ &= \frac{d}{R} \sup_{\Omega} |u|, \quad \forall R \geq \text{dist}(\Omega', \partial\Omega) \end{aligned}$$

The rest of result for  $\alpha \in \mathbb{Z}^d$  with  $|\alpha| > 1$  is obtained using induction.

(End of proof)  $\square$

**Theorem 3.1)** Let  $\Omega \subset \mathbb{R}^d$ , then  $u \in C^0(\Omega)$  harmonic in  $\Omega$  iff  $\forall y \in \Omega$  and  $\forall R > 0$ ,  $\bar{B}(y, R) \subset \Omega$ ,

$$u(y) = \frac{1}{dw_d R^{d-1}} \int_{\partial B(y, R)} u(x) dS_x \quad \dots\dots\dots \text{(MID)}$$

**proof)** We already proved the right inclusion.

For the converse direction, we use the fact that :  $\forall \varphi \in C^0(B_R), \exists \in C^2(B_R) \cap C^0(\overline{B_R})$  such that  $\Delta u = 0$  in  $B_R$  and  $u = \varphi$  on  $\partial B_R$ .

Given  $u$  satisfying (MID) in  $\overline{B(y, R)} \subset \Omega$ , let

$$\begin{aligned}\Delta h &= 0 \quad \text{in } B(y, R) \\ h &= u \quad \text{on } \partial B(y, R)\end{aligned}$$

and  $w = h - u$ . Then  $w$  also satisfies (MID), hence

$$w(y) = \frac{1}{w_d d R^{d-1}} \int_{\partial B(y, R)} w(x) dS_x, \quad w|_{\partial B(y, R)} = 0$$

But  $w(y) = 0$  on the boundary, and therefore  $w \equiv 0$  on  $B(y, R)$  by *maximum principle* (recall that we prove maximum principle only using the mean value identity). And therefore  $u \equiv h$  in  $B(y, R) \subset \Omega$ . Therefore,  $u$  is harmonic in  $\Omega$ .

(End of proof)  $\square$

**Theorem 3.2)** Given  $\Omega \subset \mathbb{R}^d$  domain.  $(u_n)_{n=1}^\infty \subset C^0(\Omega)$  such that  $\Delta u_n = 0$  in  $\Omega$  and

$$\sup_{n \in \mathbb{N}} \sup_{x \in \Omega} |u_n(x)| < \infty$$

Then  $\exists (u_{n_k})_k$  such that  $u_{n_k} \xrightarrow{\text{unif.}} u$  in any  $\Omega' \subset \Omega$  compact and  $\Delta u = 0$  in  $\Omega$ .

**proof)** By assumption,  $(u_n)_n \subset C^0(\overline{\Omega})$  is bounded. By *interior estimate for harmonic functions*,

$$\sup_n \sup_{\Omega'} |\nabla u_n| \leq \frac{d}{\text{dist}(\Omega', \partial \Omega)} \sup_{n, x} |u_n(x)| \leq M$$

So  $(u_n)$  is equicontinuous in  $C^0(\overline{\Omega'})$ . So *Ascoli's theorem* implies that  $\exists (u_{n_k})_{n_k} \rightarrow u \in C^0(\Omega')$  uniformly in  $\Omega'$ .

Also since  $u_n$  satisfies (MID) in  $\Omega'$ , and integral on compact domain and uniform limit can be exchanged,  $u$  also satisfies (MID), hence is harmonic.

(End of proof)  $\square$

**Indication :** the construction of the Perron's solution is made through a process of the form  $u = \sup\{v \in C^0(\Omega) \text{ subharmonic}, v \leq \varphi \text{ on } \partial \Omega\}$ .  $u$  will be the candidate for our solution of the Dirichlet problem.

**Definition 3.3.)** ( $C^0$  subharmonic)  $u \in C^0(\Omega)$  is **subharmonic in  $\Omega$**  if  $\forall B$  a ball in  $\Omega, \forall h$  harmonic in  $B$ ,

$$u \leq h \text{ on } \partial B \Rightarrow u \leq h \text{ in } B$$

$u \in C^0(\Omega)$  is **superharmonic in  $\Omega$**  if  $\forall B$  a ball in  $\Omega, \forall h$  harmonic in  $B$ ,

$$u \geq h \text{ on } \partial B \Rightarrow u \geq h \text{ in } B$$

**Proposition 3.4)**  $u$  is subharmonic and  $v$  is superharmonic in  $\Omega$ ,  $u, v \in C^0(\Omega)$ . Then

$$v \geq u \text{ on } \partial\Omega \Rightarrow \begin{cases} v > u & \text{in } \overline{\Omega} \\ v \equiv u & \text{in } \overline{\Omega} \end{cases} \text{ or}$$

We need a definition and a lemma to prove this proposition.

**Definition)** (*Harmonic lifting*) Given  $u \in C^0(\Omega)$  subharmonic in  $\Omega$  and  $B \subset \Omega$  a ball,  $\overline{B} \subset \Omega$ , we can define the **harmonic lifting**

$$U(x) = \begin{cases} u & \text{on } \Omega \setminus B \\ \bar{u} & \text{in } B \end{cases}$$

where  $\bar{u}$  is the solution of the Dirichlet problem with  $\bar{u} = u$  on  $\partial B$ .

**Lemma 3.6)** Let  $u \in C^0(\Omega)$  subharmonic in  $\Omega$ ,  $U$  a harmonic lifting of  $u$  with respect to  $\overline{B} \subset \Omega$ . Then  $U$  is subharmonic in  $\Omega$  and  $U \geq u$  in  $\Omega$ .

**proof)** We have to verify the condition given by **Definition 3.3.** above. Let  $B^1$  be any ball in  $\Omega$  with  $\overline{B}^1 \subset \Omega$  and let  $h$  be harmonic in  $B^1$  with  $h \geq U$  on  $\partial B^1$ . We want to prove that  $h \geq U$  in  $B^1$ .

Indeed, as  $u = U$  on  $\partial B$  and  $\Delta U = 0$  in  $B$ , one has  $u \leq U$  in  $B$ . In  $\Omega \setminus B$ ,  $U = u$ , which implies  $U \leq U$  in  $\Omega$  and so  $U \leq U$  in  $B^1$ . Therefore, by hypothesis,  $u \leq U \leq h$  on  $\partial B^1$ . Then  $u \leq h$  on  $B^1$  as  $u$  is subharmonic. This implies immediately that  $U \leq h$  in  $B^1 \setminus B$ , as  $U = u$  outside  $B$ .

Consider  $U$  in  $B^1 \cap B$ , where  $\Delta U = 0$ . By the maximal value principle for harmonic functions,  $U \leq U|_{\partial(B^1 \cap B)} \leq h|_{\partial(B^1 \cap B)}$  and therefore  $U \leq h$  in  $B^1 \cap B$  (as  $h$  is also harmonic in  $B^1 \cap B$ ). Then,  $U \leq h$  in  $B^1$  and  $U$  is subharmonic.

(End of proof)  $\square$

**Lemma 3.7)** Given  $\{u_j\}_{j=1}^N$  subharmonic functions in  $\Omega$ , we have that

$$u(x) = \max\{u_j(x) : 1 \leq j \leq N\}$$

is also subharmonic in  $\Omega$ .

**proof)** Given  $\overline{B} \subset \Omega$ , any ball and given  $h$  harmonic in  $B$  with  $h \geq u$  on  $\partial B$ , we have  $h \geq u_j$  on  $\partial B$  for all  $j = 1, \dots, N$ . Therefore,  $h \geq u_j$  in  $B$  for all  $j$  and the result follows.

(End of proof)  $\square$

(24th January, Thursday)

Recall : Let  $u$  be subharmonic in  $\Omega$  if  $\forall B$  a ball in  $\Omega$ ,  $\forall h$  harmonic in  $B$ ,  $u \leq h$  on  $\partial B$  implies  $u \leq h$  in  $B$ .

Our next goal is to solve the Perron's theorem :

**Theorem)** (*Perron*) Let  $\varphi \in C^0(\partial\Omega)$  and consider the Dirichlet problem  $-\Delta u = 0$  in  $\Omega$  and  $u = \varphi$  on  $\partial\Omega$ . Then

- (1) The classical Dirichlet problem has a unique solution  $u \in C^2(\Omega)$  if  $\partial\Omega$  regular.
- (2) If Dirichlet problem is solvable for all  $\varphi$ , then  $\partial\Omega$  is regular.

**proof of point 1)** To solve the Perrons' theorem, we want to *construct* a solution (Perron's solution). Let

$$\begin{aligned} u_\varphi(x) &= \sup\{v \in C^0(\overline{\Omega}) : v \text{ is subharmonic in } \Omega \text{ and } v \leq \varphi \text{ on } \partial\Omega\} \\ &=: \sup S_\varphi \end{aligned}$$

Let  $m = \min_{\partial\Omega} \varphi$ ,  $M = \max_{\partial\Omega} \varphi$ . Since  $\Delta M \leq 0$ ,  $M$  is a subharmonic function and therefore  $v \leq \varphi \leq M$  on  $\partial\Omega$  (by maximum value principle for subharmonic functions) gives  $v \leq M$  in  $\Omega$  for any  $v \in S_\varphi$ . Also,  $m \in C^2(\Omega) \cap C^0(\overline{\Omega})$ ,  $\Delta m \geq 0$ ,  $m \leq \varphi$  on  $\partial\Omega$  and therefore  $m \in S_\varphi$ , which tells us that  $S_\varphi \neq \emptyset$ . Hence we may find  $\sup_{v \in S_\varphi} v(x) = u_\varphi(x)$  for all  $x \in \Omega$ .

The next step is to prove that  $u_\varphi$  is in fact harmonic in  $\Omega$ .

Fixing  $\overline{B(x_0, r)} \subset \Omega$ , one may find  $(u_k)_k \subset S_\varphi$  such that  $u_k(x_0) \rightarrow u_\varphi(x_0)$ . Define

$$\tilde{v}_k := \max\{u_k, m\}$$

Note that each  $\tilde{v}_k$  is in  $S_\varphi$  (for any ball  $B \subset \Omega$  and a harmonic function  $\omega$  with  $\omega \geq \tilde{v}_k$  on  $\partial B$ ,  $\omega \geq u_k$  and  $\omega \geq m$  on  $\partial B$ , and therefore  $\omega \geq m$  on  $B$  by minimum value principle and  $\omega \geq u_k$  on  $B$  by assumption of subharmonicity of  $u_k$ ) and is bounded.

Next let  $v_k \equiv$  harmonic lifting of  $\tilde{v}_k$  in  $B(x_0, r)$ , i.e.

$$\Delta v_k = 0 \text{ in } B(x_0, r), \quad v_k = \tilde{v}_k \text{ on } \partial B(x_0, r)$$

and  $v_k \geq \tilde{v}_k$  in  $\Omega$ , by **Lemma 3.6** and moreover is subharmonic on  $\Omega$  with boundary value  $\leq \varphi$ . In particular,  $(v_k) \subset S_\varphi$ .

Since  $(v_k)_k$  is a sequence of harmonic functions in  $B(x_0, r)$ , uniformly bounded, by compactness of harmonic functions (**Theorem 3.2** of last lecture), we may find  $(v_{k_j})_j \rightarrow v$  in  $B(x_0, r)$  and  $\Delta v = 0$  in  $B(x_0, r)$ . We want to show that  $v$  is exactly  $u_\varphi$  in  $B(x_0, r)$ .

First note we have  $m \leq v_{k_j} \leq u_\varphi$  for any  $j$  so  $v \leq u_\varphi$  in  $B(x_0, r)$ . Also  $v(x_0) = u_\varphi(x_0)$ . But this is not quite enough! To complete the proof, we need a clever trick.

*An Analytic trick* : take another  $\bar{x} \in B(x_0, r)$  and consider  $w_k^I(\bar{x}) \rightarrow u_\varphi(\bar{x})$ ,  $(w_k^I) \subset S_\varphi$ . Let  $\tilde{w}_k = \max\{w_k^I, m\} \in S_\varphi$ . Then as before, we may take  $w_k$  the harmonic lifting of  $\tilde{w}_k$  in  $B(x_0, r)$ , so we may find  $w$  a limit point of  $(\tilde{w}_k)$ , harmonic in  $B(x_0, r)$  and  $w(\bar{x}) = u_\varphi(\bar{x})$ .

Now take  $v - w$ . One has  $\Delta(v - w) = 0$  in  $B(x_0, r)$  and  $(v - w)$  attains a maximum at  $x_0$  and minimum at  $\bar{x}$ , so  $v = w = u_\varphi$  in  $B(x_0, r)$ . This can be made true at any point  $x_0 \in \Omega$ , so we conclude that  $\Delta u_\varphi = 0$  in  $\Omega$ .

Now let us check the boundary value of  $u_\varphi$ . Let  $\xi \in \partial\Omega$ . Then by our assumption, we may find a barrier function  $w_b$  and such that  $w_b(\xi) = 0$ ,  $\Delta w_b \leq 0$  and  $w_b > 0$  in  $\Omega \setminus \{\xi\}$ .

We want to have  $|u_\varphi(x) - \varphi(\xi)| < \epsilon$  if  $|x - \xi| < \delta$  : fix  $\epsilon$  and find  $\delta > 0$  such that  $|\varphi(x) - \varphi(\xi)| < \epsilon$  whenever  $|x - \xi| < \delta$ . As  $w > 0$  for  $x \in V_\xi^\delta := B(\xi, \delta) \cap \Omega$ , we also have

$$\inf_{|x-\xi| \geq \delta} w(x) \geq \frac{2 \sup_{\partial\Omega} |\varphi|}{h}$$

for some  $h$  large enough. Now define the functions on  $\Omega$ ,

$$\begin{aligned} u^+(x) &:= \varphi(\xi) + \epsilon + hw_b(x) \geq \varphi \\ u^-(x) &:= \varphi(\xi) - \epsilon - hw_b(x) \leq \varphi \end{aligned}$$

Note that by our choice of  $h$  and  $\delta$ , we have  $\inf_{|x-\xi| \geq \delta} w_b(x) \geq \frac{2 \sup_{\partial\Omega} |\varphi|}{h}$ . Moreover  $u^+$  is a superharmonic function and  $u^-$  is a subharmonic function. Now by the *maximal principle*,  $u^- \leq u_\varphi \leq u^+$  around  $\xi$  (in  $V_\xi^\delta$ ) so

$$\begin{aligned} \varphi(\xi) - \epsilon - hw_b &\leq u_\varphi(x) \leq \varphi(\xi) + \epsilon + hw_b \\ \Rightarrow |u_\varphi(x) - \varphi(\xi)| &\leq \epsilon + hw_k \end{aligned}$$

Taking  $|x - \xi| \rightarrow 0$  and  $\epsilon > 0$  arbitrary small gives the desired boundary condition for  $u_\varphi$ .

(End of proof)  $\square$

## Poisson equation

Consider the problem

$$\begin{cases} \Delta u = -f & \text{in } \Omega \\ u = \varphi & \text{on } \partial\Omega \end{cases}$$

First we want to find the fundamental solution :  $\Delta E = \delta_{x=0}$  with  $E \in C^\infty(\mathbb{R}^d \setminus \{0\})$ , i.e. the fundamental solution. We have

$$E(x) = \begin{cases} \frac{1}{2}|x|, & d = 1 \\ \frac{1}{2\pi} \log |x|, & d = 2 \\ \frac{1}{dw_d(d-2)} |x|^{2-d}, & d \geq 3 \end{cases}$$

**proof)** Estimates on  $E$  and derivative.

$$\begin{aligned} |\partial_{x_i} E(x - y)| &\leq \frac{1}{dw_d} |x - y|^{1-d} \\ |\partial_{x_i x_j}^2 E(x - y)| &\leq \frac{2}{w_d} |x - y|^{-d} \end{aligned}$$

Detailed computation is on the handwritten notes.

## Green's representation

**Proposition 4.3)** Assume that  $u \in C^2(\Omega) \cap C^0(\overline{\Omega})$ , solving Poisson's equation

$$\begin{cases} \Delta u = -f, & f \in C^0(\Omega) \\ u = \varphi, & \varphi \in C^0(\partial\Omega) \end{cases}$$

Then

$$u(y) = \int_{\partial\Omega} \left( \varphi \frac{\partial E}{\partial n_x}(x - y) - E(x - y) \frac{\partial u}{\partial n_x}(x) \right) dS_x + \int_{\Omega} E(x - y) f(x) dx$$

**proof)** Let  $\Omega_\rho = \Omega \setminus B(y, \rho)$ . Recall : for a  $C^1$ -function  $w$ , one has

$$\int_{\Omega_\rho} \operatorname{div} w dx = \int_{\partial\Omega_\rho} w n_x dS_x$$

Then

$$\begin{aligned} \int_{\Omega_\rho} \Delta_x E(x-y) u dx + \int_{\Omega_\rho} \nabla_x u \nabla_x E(x-y) dx &= \int_{\partial\Omega_\rho} u(x) \frac{\partial E}{\partial n_x}(x-y) dS_x \\ \int_{\Omega_\rho} \Delta u(x) E(x-y) dx + \int_{\Omega} \nabla_x u \nabla_x E(x-y) dx &= \int_{\partial\Omega_\rho} E(x-y) \frac{\partial u}{\partial n_x}(x) dS_x \end{aligned}$$

so subtracting these two, we have

$$\int_{\Omega_\rho} \Delta_x E(x-y) u(x) - \Delta u(x) E(x-y) dx = \int_{\partial\Omega_\rho} u(x) \frac{\partial E}{\partial n_x}(x-y) - E(x-y) \frac{\partial u}{\partial n_x}(x) dS_x$$

and noting  $\Delta E(x-y) = 0$ ,  $\Delta u = -f$ , we find that the result holds on  $\Omega_\rho$ . So we are just left to show that contribution of  $B(y, \rho)$  on each term converges to 0 as  $\rho \rightarrow 0^+$ . This far, we check that

$$\begin{aligned} \int_{B(y, \rho_1) \setminus B(y, \rho_2)} f(x) E(x-y) dx &\leq C |B(y, \rho_1) \setminus B(y, \rho_2)| \sup_{B(y, \rho_1) \setminus B(y, \rho_2)} f \\ \int_{\partial B(y, \rho)} E(x-y) \frac{\partial u}{\partial n_x}(x) dS_x &= E(\rho) \int_{\partial B(y, \rho)} \frac{du}{dn} dS_x \leq E(\rho) \max_{\Omega} |\nabla u| |\partial\Omega_\rho| \\ \int_{\partial B(y, \rho)} u(x) \frac{\partial E}{\partial n_x}(x-y) dS_x &= E'(\rho) \int_{\partial B(y, \rho)} u(x) dS_x \\ &\leq \frac{1}{dw_d} \rho^{1-d} \int_{\partial B(y, \rho)} u(x) dS_x = \frac{1}{\operatorname{meas}(\partial\Omega_p)} \int_{\partial B(y, \rho)} u(x) dS_x \end{aligned}$$

as  $u \in C^0(\overline{\Omega})$ , we have each value line converging to 0 as  $\rho_2 < \rho_1, \rho \rightarrow 0^+$ .

(End of proof)  $\square$

(26th January, Saturday)

We have been discussing about the problem,

$$\begin{cases} -\Delta u = f & \text{in } \Omega \\ u = \varphi & \text{on } \partial\Omega \end{cases} \dots\dots\dots (D)$$

where  $\Omega$  is a bounded set in  $\mathbb{R}^d$  and  $\partial\Omega$  is regular for the  $\Delta$ .

We now assume that  $\varphi \in C^0(\partial\Omega)$  and  $f \in C^0(\Omega)$  is **locally Hölder**.

**Definition)**  $f \in C^0(\Omega)$  is **locally Hölder** if for  $\alpha \leq 1$ ,  $\forall x \in \Omega$ ,  $\exists \delta > 0$ ,  $\exists C_{x,\alpha} > 0$  such that  $|f(x) - f(y)| \leq C_{x,\alpha} |x - y|^\alpha$  for all  $y \in B(x, \delta)$ .

**Theorem 5.3)** Under these hypothesis, the Dirichlet problem has a unique solution  $u \in C^2(\Omega) \cap C^0(\overline{\Omega})$ .

*Observation :* if we can find a classical solution to  $\Delta w = f$  without assuming the boundary condition, then since we know from Perron's method that we can solve Laplace's equation with

any continuous boundary condition, we can add some harmonic function to  $w$  to construct a solution to the Dirichlet problem.

What we do is the following : Recall that, we have proved that if  $E(x)$  is the fundamental solution and if  $u$  gives a classical solution of the Dirichlet problem, then

$$u(y) = \int_{\Omega} E(x-y)f(x)dx + \int_{\partial\Omega} u(x)\frac{\partial E}{\partial n_x}(x-y) - \frac{\partial u}{\partial n_x}(x)E(x-y)dS_x$$

So if we can construct a function  $G(x, y)$  so that  $G(x, y) = E(x-y) + h(x, y)$  with  $\Delta_x h = 0$  such that  $G(x, y)|_{x \in \partial\Omega} = 0$ , then this can be rewritten as

$$u(y) = \int_{\Omega} G(x, y)f(x)dx + \int_{\partial\Omega} \varphi(x)\frac{\partial G}{\partial n_x}(x, y)dS_x$$

**Definition) Green's function** is  $G(x, y) = E(x-y) + h(x, y)$  with  $\Delta_x h = 0$  such that  $G(x, y)|_{x \in \partial\Omega} = 0$ . (or sometimes given with the roles of  $x$  and  $y$  interchanged)

Construction of the solution of  $(D)$  is made in two steps.

**1st.** Given  $f \in C^0(\Omega) +$  locally Hölder  $\alpha$ , we set

$$W(x) = \int_{\Omega} E(x-y)f(y)dy, \quad x \in \mathbb{R}^d \quad \dots\dots\dots (\dagger)$$

We shall prove  $W \in C^2(\mathbb{R}^d)$ ,  $W|_{\partial\Omega} \in C^0(\partial\Omega)$  and  $\Delta W = f$  in  $\Omega$ .

**2nd.** We use Perrons' theorem to solve

$$\begin{cases} \Delta \tilde{u} = 0 & \text{in } \Omega \\ \tilde{u} = \varphi - W|_{\partial\Omega} & \text{on } \partial\Omega \end{cases}$$

Then we already know  $\tilde{u} \in C^2(\Omega) \cap C^0(\overline{\Omega})$  since  $\varphi - W|_{\partial\Omega} \in C^0(\partial\Omega)$ .

Set  $u = W + \tilde{y}$ , then  $-\Delta u = f$  and  $u|_{\partial\Omega} = \varphi$  on  $\partial\Omega$ .

So  $W$  defined in  $(\dagger)$  would be our central object of study.

**Lemma 5.1)** Under the hypothesis that  $f \in L^1(\Omega) \cap L^\infty(\Omega)$ ,  $W$  in  $(\dagger)$  is  $C^1(\mathbb{R}^d)$  and

$$\partial_{x_j} W(x) = \int_{\Omega} \partial_{x_j} E(x-y)f(y)dy, \quad \forall x \in \mathbb{R}^d$$

**Idea :** Near the singularity of  $E$ , the singularity integrable, and at  $\infty$ , we use the fact that  $f$  is integrable to bound the integral. So roughly, as  $|\nabla E(x-y)| \leq \frac{1}{dw_d}|x-y|^{1-d}$ , we have

$$|\partial_{x_j} W(x)| \leq \int_{|x-y| < R} \frac{1}{dw_d}|x-y|^{1-d}|f(y)|dy + \int_{|x-y| \geq R} \frac{1}{dw_d}|x-y|^{1-d}|f(y)|dy$$

For  $R$  small enough, this is bounded by

$$|\partial_{x_j} W(x)| \leq \frac{1}{dw_d} \|f\|_{L^\infty(\Omega)} \int_{|x-y| < R} \frac{dy}{|x-y|^{d-1}} + \frac{1}{dw_d R^{d-1}} \int_{\mathbb{R}^d} |f(y)|dy$$

**proof)** To justify this idea, we use cut-off of function  $E$  : given  $\epsilon > 0$ , define  $\eta_\epsilon(x) = \eta(|x|/\epsilon)$  where  $\eta$  is smooth and

$$\eta(x) \in [0, 1], \quad \eta(0) = 0, \quad \eta(x) = 0 \quad \forall |x| \geq 2 \\ |\nabla \eta| \leq 2$$

Define  $V_\epsilon(x)$  as

$$V_\epsilon(x) = \int_{\mathbb{R}^d} E(x-y) \eta_\epsilon(x-y) f(y) dy$$

★**Claim :**  $V_\epsilon \rightarrow u$  and  $\partial_{x_j} V_\epsilon \rightarrow \partial_{x_j} W(x) =: F(x)$  as  $\epsilon \rightarrow 0$  uniformly on compact sets.

: first note that

$$\partial_{x_j} V_\epsilon(x) = \int_{\mathbb{R}^d} \left[ \partial_{x_j} E(x-y) \eta_\epsilon(x-y) + E(x-y) \partial_{x_j} \eta_\epsilon(x-y) \right] f(y) dy$$

so

$$|F(x) - \partial_{x_j} V_\epsilon(x)| = \left| \int_{|x-y| < 2\epsilon} \partial_{x_j} ((1 - \eta_\epsilon)E)(x-y) f(y) dy \right| \\ = \left| \int_{|x-y| < 2\epsilon} \left( -\partial_{x_j} \eta_\epsilon(x-y) E(x-y) + (1 - \eta_\epsilon) \partial_{x_j} E(x-y) \right) f(y) dy \right|$$

We have  $\partial_{x_j} \eta_\epsilon(x-y) = \frac{1}{\epsilon} \eta_{x_j}(\frac{x-y}{\epsilon})$  so

$$\leq \int_{|x-y| < 2\epsilon} |\partial_{x_j} \eta_\epsilon(x-y)| |E(x-y)| |f(y)| dy + \int_{|x-y| < 2\epsilon} (1 - \eta_\epsilon(x)) |\partial_{x_j} E(x-y)| |f(y)| dy \\ \leq \frac{2}{\epsilon} \|f\|_{L^\infty} \int_{|x-y| < 2\epsilon} |E(x-y)| dy + \|f\|_{L^\infty} \int_{|x-y| < 2\epsilon} |\partial_{x_j} E(x-y)| dy \\ \leq \frac{2}{\epsilon} \|f\|_{L^\infty} \int_0^{2\epsilon} \int_{S^{d-1}} \frac{r^{d-1}}{r^{d-2}} dS_\omega dr + c_d \|f\|_{L^\infty} \iint \frac{r^{d-1}}{r^{d-1}} dS_\omega dr \\ = \frac{2}{\epsilon} \|f\|_{L^\infty} |S^{d-1}| \frac{1}{2} (2\epsilon)^2 + c_d \|f\|_{L^\infty} 2\epsilon |S^{d-1}| o(\epsilon)$$

Once we have the claim, the lemma follows directly.

(End of proof)  $\square$

**Lemma 5.2)** Let  $f \in L^1 \cap L^\infty(\Omega)$  and  $|f(x) - f(y)| \leq C_{\alpha,x} |x-y|^\alpha$  locally around any  $x \in \Omega$ . then  $W$  as above is  $C^2(\mathbb{R}^d)$  and for any  $\Omega_0 \subset \mathbb{R}^d$  such that the divergence theorem holds we have

$$\partial_{x_i x_j} W(x) = \int_{\Omega_0} \partial_{x_i x_j} E(x-y) (f(y) - f(x)) dy \\ - f(x) \int_{\partial\Omega_0} \partial_{x_j} E(x-y) (n_y \cdot e_i) dS_y =: F_{ij}(x) \quad \dots\dots\dots (**) \\$$

where  $e_i$  are standard bases of  $\mathbb{R}^d$ , and  $\partial_{x_i x_j} E(x-y)$  should be understood as a distribution.

**proof)** Use similar cutoff function, having in addition  $\partial_{ij} V_\epsilon \rightarrow F_{ij}$ .

Having these, we readily have the result.

**proof of Theorem 5.3)** Assuming that  $(**)$  holds, take  $i = j$ ,  $\Omega_0 = B(x, r) \subset \Omega$ , then

$$\partial_{x_i}^2 W(x) = \int_{B(x, r)} E(x - y)(f(y) - f(x)) dy - f(x) \int_{\partial B(x, r)} \partial_{x_i} E(x - y)(n_y \cdot e_i) dS_y$$

so

$$\Delta W = \sum_{i=1}^d \partial_{x_i}^2 W(x) = \int_{B(x, r)} \Delta E(x - y)(f(y) - f(x)) dx - f(x) \int_{\partial B(x, r)} \sum_{i=1}^d \frac{1}{dw_d r^{d-1}} (n_y \cdot e_i)^2 dS_y$$

where we used  $E(x - y) = \frac{1}{d(d-2)w_d} |x - y|^{2-d}$ ,  $\partial_{x_j} E(x - y) = \frac{1}{dw_d} \frac{x_j - y_j}{|x - y|^{d-1}}$ . But  $\Delta E(x - y) = \delta_{x=y}$ , so this equals

$$\Delta W = 0 - f(x) \frac{1}{dw_d r^{d-1}} |\partial B(x, r)| = -f(x)$$

as claimed.

Therefore, using the procedure explained earlier in the lecture, we have proved **Theorem 5.3**.

(End of proof)  $\square$

(29th January, Tuesday)

We have proved : Using potential theory,  $-\Delta u = f$  on  $\Omega$ ,  $u = \varphi$  on  $\partial\Omega$  has unique solution  $u \in C^2(\Omega) \cap C^0(\overline{\Omega})$ . For the uniqueness, we used maximal principles, and properties of harmonic functions.

We are now moving on to regularity properties of solutions, the *Hölder regularity*. We will first see an elementary Hölder estimate, move on to Schauder theory, and also see De Giorgi & Nash theory.

In Schauder theory, we deal with  $Lu = f$ , where  $L$  is an elliptic operator with smooth coefficients. But to do this, we need some more knowledge in the Laplacian.

**Hölder solutions for  $-\Delta u = f$**

**Definition)** Assume  $|f(x) - f(y)| \leq C_\alpha |x - y|^\alpha$  for all  $x, y \in \Omega$ , and define

$$[f]_{\alpha, \Omega} = \sup_{x \neq y, x, y \in \Omega} \frac{|f(x) - f(y)|}{|x - y|^\alpha}$$

and  $\|f\|_{C^{0, \alpha}(\Omega)} = \|f\|_{C^0(\Omega)} + [f]_{\alpha, \Omega}$  and also

$$\|f\|_{C^{k, \alpha}(\Omega)} = \|f\|_{C^k(\Omega)} + \sup_{|\beta|=k} [\partial^\beta f]_{\alpha, \Omega}$$

where  $\|f\|_{C^k(\Omega)} = \sum_{|\beta| \leq k} \|\partial^\beta f\|_{C^0(\Omega)}$ .

Now Rescale the norms w.r.t.  $\Omega$ . Letting  $d = \text{diam}(\Omega) = \sup\{|x - y| : x, y \in \overline{\Omega}\}$ , define

$$\begin{aligned} \|f\|'_{C^k(\Omega)} &= \sum_{j=0}^k d^j \sup_{|\beta|=j} \sup_{\Omega} |\partial^\beta f| \\ \|f\|'_{C^{k, \alpha}(\Omega)} &= \|f\|'_{C^k(\Omega)} + d^{k+\alpha} \sup_{|\beta|=k} [\partial^\beta f]_{\alpha, \Omega} \end{aligned}$$

We first start the study of Hölder regularity locally.

**Lemma 6.1)** Let  $x_0 \in \mathbb{R}^d$ ,  $B_2 = B(x_0, 2R)$ ,  $B_1 = B(x_0, R)$ ,  $f \in C^{0,\alpha}(\overline{B_2})$ ,  $0 < \alpha < 1$ , then  $W$  defined by  $W(x) = \int_{\Omega} E(x-y)f(y)dy$  is in  $C^{2,\alpha}(B_1)$ . Furthermore,

$$\|D^2W\|'_{C^{0,\alpha}(B_1)} \leq C\|f\|'_{C^{0,\alpha}(B_2)}$$

Equivalently,  $\|D^2W\|_{C^0(B_1)} + R^\alpha[D^2W]_{\alpha,B_1} \leq C\left(\|f\|_{C^0(\overline{B_2})} + R^\alpha[f]_{\alpha,B_2}\right)$

**proof)** The only thing we can do at this point is just to compute the difference and make estimate on Hölder norm directly. *[Giorgi method introduced later is an improved version of this, using the idea of oscillation (see later).]* Fix  $x, \bar{x} \in B_1$ . Let  $0 < \delta := |x - \bar{x}| < 2R$  and  $\xi = \frac{1}{2}(x + \bar{x})$ .

$$\begin{aligned}\partial_{x_i x_j}^2 W(x) &= \int_{B_2} \partial_{x_i x_j}^2 E(x-y) \left(f(y) - f(x)\right) dy - f(x) \int_{\partial B_2} \partial_{x_i} E(x-y) (n_y \cdot e_j) dS_y \\ \partial_{x_i x_j}^2 W(\bar{x}) &= \int_{B_2} \partial_{x_i x_j}^2 E(\bar{x}-y) \left(f(y) - f(\bar{x})\right) dy - f(\bar{x}) \int_{\partial B_2} \partial_{x_i} E(\bar{x}-y) (n_y \cdot e_j) dS_y\end{aligned}$$

Then

$$\partial_{x_i x_j}^2 W(\bar{x}) - \partial_{x_i x_j}^2 W(x) = f(x)I_1(f(x) - f(\bar{x}))I_2 + I_3 + I_4 + (f(x) - f(\bar{x}))I_5 + I_6$$

where

$$\begin{aligned}I_1 &= \int_{\partial B_2} (\partial_{x_i} E(x-y) - \partial_{x_i} E(\bar{x}-y))(e_j \cdot n_y) dS_y \\ I_2 &= \int_{\partial B_2} \partial_{x_j} E(\bar{x}-y)(e_j \cdot n_y) dS_y \\ I_3 &= \int_{B(\xi, \delta)} \partial_{x_i x_j}^2 E(x-y)(f(x) - f(y)) dy \\ I_4 &= \int_{B(\xi, \delta)} \partial_{x_i x_j}^2 E(\bar{x}-y)(f(\bar{x}) - f(y)) dy \\ I_5 &= \int_{B_2 \setminus B(\xi, \delta)} \partial_{x_i x_j}^2 E(x-y) dy \\ I_6 &= \int_{B_2 \setminus B(\xi, \delta)} (\partial_{x_i x_j}^2 E(x-y) - \partial_{x_i x_j}^2 E(\bar{x}-y))(f(\bar{x}) - f(y)) dy\end{aligned}$$

Let us estimate term by term. The goal is to bound the sum by  $C[f]_{\alpha, B_2} \delta^\alpha$ .

$$\begin{aligned}|I_1| &\leq \int_{\partial B_2} |\partial_{x_j} E(x-y) - \partial_{x_j} E(\bar{x}-y)| dS_y \\ &\leq |x - \bar{x}| \int_{\partial B_2} |\nabla \partial_{x_j} E(x_{int} - y)| dS_y \quad (\text{some } x_{int} \in [x, \bar{x}]) \\ &\leq |x - \bar{x}| \frac{d}{(R)^d w_d} |\partial B_2| \quad (\text{using } |\nabla \partial_{x_j} E(x-y)| \leq \frac{1}{dR^d w_d}) \\ &\leq |x - \bar{x}| \frac{d^2 2^{d-1}}{R} = \delta \frac{d^2 2^{d-1}}{R} \\ &\leq d^2 2^{d-\alpha} \delta^\alpha R^{-\alpha} \quad (\text{as } \delta < 2R)\end{aligned}$$

For  $I_2$ ,

$$|I_2| \leq \left| \int_{\partial B_2} \partial_{x_j} E(x-y) dS_y \right| \leq \frac{1}{dw_d (2R)^{d-1}} dw_d (2R)^{d-1} = 1$$

For  $I_3$  and  $I_4$ ,

$$\begin{aligned}
|I_3| &\leq \int_{B(\xi, \delta)} |\partial_{x_i x_j}^2 E(x - y)| \frac{|f(x) - f(y)|}{|x - y|^\alpha} |x - y|^\alpha dy \\
&\leq [f]_{\alpha, B_2} \int_{B(\xi, \delta)} C_d |x - y|^{-d+\alpha} dy \\
&\leq C_2(d) [f]_{\alpha, B_2} \delta^\alpha
\end{aligned}$$

For  $I_5$ , by Green's theorem, and because  $\int_{\partial B_2} |\partial_{x_i} E(x - y)| \leq \frac{1}{dw_d} |x - y|^{1-d}$ ,

$$|I_5| \leq \int_{\partial B_2} |\partial_{x_i} E(x - y)| dS_y + \int_{\partial B(\xi, \delta)} |\partial_{x_i} E(x - y)| dS_y \leq C_3(d)$$

For  $I_6$ ,

$$\begin{aligned}
|I_6| &\leq [f]_{\alpha, B_2} \int_{B_2 \setminus B(\xi, \delta)} \left| \partial_{x_i x_j}^2 E(x - y) - \partial_{x_i x_j}^2 E(\bar{x} - y) \right| |x - y|^\alpha dy \\
&\leq \delta [f]_{\alpha, B_2} \int_{B_2 \setminus B(\xi, \delta)} \left| \nabla \partial_{x_i x_j}^2 E(x_{int} - y) \right| |x - y|^\alpha dy \\
&\leq C_4(d)' \delta [f]_{\alpha, B_2} \int_\delta^{2R} r^{-1-d} r^\alpha r^{d-1} dr \\
&\leq C_4(d)'' \delta [f]_{\alpha, B_2} \left[ \frac{1}{\alpha - 1} r^{\alpha-1} \right]_{r=\delta}^{2R} \\
&\leq C_4(d) [f]_{C^{0, \alpha}} \delta^\alpha
\end{aligned}$$

where we used  $|\partial_{x_i x_j}^2 E(x - y) - \partial_{x_i x_j}^2 E(\bar{x} - y)| \leq \delta |\nabla \partial_{x_i x_j}^2 E(x_{int}^* - y)|$  for some  $x_{int}^* \in [x, \bar{x}]$  the second inequality and  $|\bar{x} - y| \leq \frac{3}{2} |\xi - y| \leq 3 |x_{int} - y|$  in the third inequality.

(End of proof)  $\square$

**Corollary 6.2)** Let  $u \in C_0^2(\mathbb{R}^d)$ ,  $f \in C^{0, \alpha}(\mathbb{R})$  compactly supported and such that  $-\Delta u = f$  in  $\mathbb{R}^d$ . Then  $u \in C^{2, \alpha}(\mathbb{R}^d)$ , and if  $B = B(x_0, R)$  is any ball containing  $\text{supp}(u)$  (the support is compact by its definition), we have

$$\|D^2 u\|'_{C^{0, \alpha}(B)} \leq C [f]'_{0, \alpha, B}$$

for some  $C = C(d, \alpha)$  and

$$\|u\|_{C^{1, \alpha}(B)} \leq C' R^2 [f]_{0, B}$$

for some  $C' = C(d)$ .

**proof)** This follows from **Lemma 5.1** and **Lemma 6.1**, and **Perron's theorem** for construction of solution to the Poisson's equation.

(End of proof)  $\square$

**Proposition 6.3)**  $\Omega \subset \mathbb{R}^d$  domain,  $f \in C^{0, \alpha}(\Omega)$  and  $u \in C^2(\Omega)$  be the solution of  $-\Delta u = f$  in  $\Omega$ . Then  $u \in C^2(\Omega) \cap C^0(\bar{\Omega})$  and satisfies, for all balls  $B_1 = (x_0, R)$ ,  $B_2 = B(x_0, 2R) \subset \Omega$ ,

$$\|u\|'_{C^{2, \alpha}(B_1)} \leq C (\|u\|_{C^0(B_2)} + \|f\|'_{C^{0, \alpha}(B_2)})$$

for some  $C = C(d, \alpha) > 0$ .

**proof**) The proof is immediate using that  $u = v(x) + W(x)$ , where  $v$  is a harmonic function in  $\Omega$  and  $W$  is given by  $\int_{\Omega} E(x-y)f(y)dy$  - the construction in **Perron's theorem**.

Using **Theorem 2.9** on  $v$  (note that Perron's theorem already indicates  $v$  is in smooth, but the  $C^2$ -norm of  $v$  might depend on the domain, and is not given in terms of  $C^0$ -norm of  $v$ ) and **Lemma 5.1** and **Lemma 6.1** on  $W$ , we get the result.

(End of proof)  $\square$

(31st January, Thursday)

We can prove this estimate in more general setting, when  $Lu = f$  with

$$Lu = \sum_{i,j=1}^d a^{ij}(x) \partial_{x_i x_j}^2 u + \sum_{i=1}^d b^i(x) \partial_{x_i} u + c(x)u, \quad u \in C^2(\Omega)$$

$a^{ji} = a^{ij}$  (symmetric) and  $\Lambda |\xi|^2 \leq a^{ij}(x) \xi_i \xi_j \leq \lambda |\xi|^2$  for some  $\lambda, \Lambda > 0$  (uniformly elliptic) and all  $\xi \in \mathbb{R}^d$ .

**Idea of Schauder estimate :** If  $a^{ij}$ ,  $b^i$  and  $c$  are sufficiently regular, and is uniformly elliptic, then we may think  $a^{ij} \simeq$  (constant coefficients) so  $a^{ij} \partial_{x_i} \partial_{x_j} \simeq -\Delta$ . Once we establish the result for homogeneous constant-coefficient elliptic operators, then we can use this result to obtain regularity for the general case using this principle.

## Hölder norms(II)

For sake of simplicity in the expressions of the results we will obtain, we introduce different forms of Hölder norms, that are equivalent to the original Hölder norm. These notations were introduced by Nirenberg at 1950s, which is about 20years after Schauder's original work was published.

**Definition** (*More Hölder norms*) Assume  $\Omega$  is compact. For  $x, y \in \Omega$ , let  $d_x = \text{dist}(x, \partial\Omega)$ ,  $d_y = \text{dist}(y, \partial\Omega)$  and  $d_{x,y} := \min\{d_x, d_y\}$ . Define

$$[u]_{k,0,\Omega}^* = \sup_{x \in \Omega} \sup_{|\beta|=k} d_x^k |\partial^\beta u(x)|$$

$$|u|_{k,\Omega}^* = \sum_{j=0}^k [u]_{j,0,\Omega}^*$$

, a norm in  $C^k(\overline{\Omega})$ . Also for  $u \in C^{k,\alpha}$ , define a norm in  $C^{k,\alpha}(\overline{\Omega})$ ,

$$|u|_{k,\alpha,\Omega}^* = |u|_{k,\Omega}^* + \sup_{|\beta|=k} \sup_{x,y \in \Omega} \left( d_{x,y}^{k+\alpha} \frac{|\partial^\beta u(x) - \partial^\beta u(y)|}{|x-y|^\alpha} \right) =: |u|_{k,\Omega}^* + [u]_{k,\alpha,\Omega}^*$$

Note that  $|u|_{k,\alpha,\Omega}^* \leq \max\{1, d\} |u|_{k,\alpha,\Omega}$ . Also, if  $\Omega' \subset \Omega$ ,  $\sigma = \text{dist}(\Omega', \partial\Omega)$ ,  $\min\{1, \sigma^{k+\alpha}\} |u|_{k,\alpha,\Omega'} \leq |u|_{k,\alpha,\Omega}^*$  so these two norms are in fact equivalent.

For all  $j \in \mathbb{N}$ , also define

$$\begin{aligned} [u]_{k,0,\Omega}^{(j)} &= \sup_{|\beta|=k} \sup_{x \in \Omega} d_x^{k+j} |\partial^\beta u(x)| \\ [u]_{k,\alpha,\Omega}^{(j)} &= \sup_{|\beta|=k} \sup_{x,y \in \Omega} d_{x,y}^{k+\alpha+j} \frac{|\partial^\beta u(x) - \partial^\beta u(y)|}{|x-y|^\alpha} \\ |u|_{k,\Omega}^{(j)} &= \sum_{l=1}^k [u]_{l,0,\Omega}^{(j)} \\ |u|_{k,\alpha,\Omega}^{(j)} &= |u|_{l,0,\Omega}^{(j)} + [u]_{k,\alpha,\Omega}^{(j)} \end{aligned}$$

Let  $L_0$  only have 2nd order terms, i.e.  $L_0 u = \sum a^{ij} \partial_{x_i x_j}^2 u$ .

**Proposition 7.2)** Let  $L_0$  satisfy *uniform ellipticity* and *symmetry*, and  $u \in C^2(\Omega)$  satisfy  $L_0 u = f$ ,  $f \in C^{0,\alpha}(\Omega)$ . Then

$$|u|_{2,\alpha,\Omega}^* \leq C(|u|_{0,\Omega} + |f|_{0,\alpha,\Omega}^{(2)})$$

for some  $C \equiv C(d, \alpha, \lambda, \Lambda) > 0$ .

**proof)** Change basis to which  $A$  is diagonal. That is, if we have  $\tilde{A} = \begin{pmatrix} \lambda_1 & \cdots & 0 \\ \vdots & \ddots & \vdots \\ 0 & \cdots & \lambda_d \end{pmatrix}$ ,

$A = P^* \tilde{A} P$  and  $P$  orthogonal, then make change of coordinates,  $y = Qx = DPx$  and  $u(x) = \tilde{u}(y)$ , so  $a^{ij} \partial_{x_i x_j}^2 u(x) = \delta^{ij} \partial_{y_i y_j}^2 \tilde{u}(y)$ , where we defined  $D$  by

$$D = \begin{pmatrix} 1/\sqrt{\lambda_1} & \cdots & 0 \\ \vdots & \ddots & \vdots \\ 0 & \cdots & 1/\sqrt{\lambda_d} \end{pmatrix}$$

Also, if we let  $\tilde{f}(y) = f(x)$ , with these notations,  $L_0 u(x) = f(x)$  can be written as  $\Delta \tilde{u}(y) = \tilde{f}(y)$ . While, most regularity of the solution is preserved under this transformation - since we have  $P \in O(d)$ , whenever a function  $v$  is transformed with  $\tilde{v}(y) = v(x)$ , by chain rule,

$$\begin{aligned} \frac{1}{\sqrt{\Lambda}} |x| &\leq |Qx| \leq \frac{1}{\sqrt{\lambda}} |x| \quad \forall x \in \mathbb{R}^d, \\ \frac{1}{C} |v|_{k,\alpha,\Omega}^* &\leq |\tilde{v}|_{k,\alpha,\Omega}^* \leq C |v|_{k,\alpha,\Omega}^*, \\ \frac{1}{C} |v|_{0,\alpha,\Omega}^{(k)} &\leq |\tilde{v}|_{0,\alpha,\Omega}^{(k)} \leq C |v|_{k,\alpha,\Omega}^{(k)} \quad C = C(d, \alpha, \lambda, \Lambda) > 0 \end{aligned}$$

By an earlier result about regularity of Poisson's equation (e.g. **Proposition 6.3**), and since  $\Delta \tilde{u} = \tilde{f}$ , we have

$$\begin{aligned} |u|_{2,\alpha,\Omega}^* &\leq C |\tilde{u}|_{2,\alpha,\Omega}^* \leq C' (|\tilde{u}|_{0,\Omega} + |\tilde{f}|_{0,\alpha,\Omega}^{(2)}) \\ &\leq C'' (|u|_{0,\Omega} + |f|_{0,\alpha,\Omega}^{(2)}) \end{aligned}$$

(End of proof)  $\square$

**Crucial observation :** Consider the general case  $L = \sum a^{ij}(x)\partial_{ij}^2 + \sum b^i(x)\partial_i + c(x)$ ,  $Lu = f$ . we may think of  $x_0 \in \Omega$  fixed, and  $L_0u = \sum_{i,j=1}^d a^{ij}(x_0)\partial_{x_i x_j}^2 u$ . Then

$$\begin{aligned} L_0u &= \sum_{i,j=1}^d a^{ij}(x_0)\partial_{x_i x_j}^2 u \\ &= \sum_{i,j=1}^d (a^{ij}(x_0) - a^{ij}(x))\partial_{x_i x_j}^2 u + \sum_{i,j=1}^d a^{ij}(x)\partial_{x_i x_j}^2 u + \left(\sum b^i\partial_i u + cu\right) - \left(\sum b^i\partial_i u + cu\right) \\ &= \sum_{i,j=1}^d (a^{ij}(x_0) - a^{ij}(x))\partial_{x_i x_j}^2 u - \sum_{i=1}^d b^i(x)\partial_{x_i} u - c(x)u + f \end{aligned}$$

So we have an equation  $L_0u = F(x)$ , for  $u \in C^2(\Omega)$ , with

$$F(x) = \sum_{i,j=1}^d (a^{ij}(x_0) - a^{ij}(x))\partial_{x_i x_j}^2 u - \sum_{i=1}^d b^i(x)\partial_{x_i} u - c(x)u + f$$

where we intend  $a^{ij}(x_0) - a^{ij}(x)$  to be small. If we show that  $F(x)$  has small contribution on the regularity of our solution, then we would be able to prove regularity of the solution in this general case.

**Theorem 7.4)** (*Interior Schauder estimate for  $Lu = f$* ) Let  $\Omega \subset \mathbb{R}^d$  be open,  $L$  be uniformly elliptic, symmetric,  $f \in C^{0,\alpha}(\Omega)$  and  $|a^{ij}|_{0,\alpha,\Omega}^{(0)}, |b^i|_{0,\alpha,\Omega}^{(1)}, |c|_{0,\alpha,\Omega}^{(2)} \leq \tilde{\Lambda}$ . Then if  $u \in C^2(\Omega)$  with  $Lu = f$ , we have the estimate

$$|u|_{2,\alpha,\Omega}^* \leq C(|u|_{0,\Omega} + |f|_{\alpha,\Omega}^{(2)})$$

for a constant  $C = C(d, \alpha, \lambda, \tilde{\Lambda})$ .

**Remark :** We may assume  $\Omega$  is compact, as we may take nested sequence of compact sets that covers  $\Omega$ , if the constants uniform in this family of compact sets - which is indeed the case.

(2nd February, Saturday)

To prove **Theorem 7.4**, We first introduce two interpolation lemmas to control regularity.

**Lemma 1)** For any  $\sigma, \tau \geq 0$ ,

$$|fg|_{0,\alpha,\Omega}^{(\sigma+\tau)} \leq |f|_{0,\alpha,\Omega}^{(\sigma)} + |g|_{0,\alpha,\Omega}^{(\tau)}$$

**Lemma 2)** (*Interpolation, Hörmander*) Let  $u \in C^{2,\alpha}(\Omega)$ ,  $\Omega \subset \mathbb{R}^d$  be a domain. Then for any  $\epsilon > 0$ , there is a constant  $C(\epsilon) > 0$  such that

$$\begin{aligned} [u]_{j,\beta,\Omega}^* &\leq C(\epsilon)|u|_{0,\Omega} + \epsilon[u]_{2,\alpha,\Omega}^* \\ |u|_{j,\beta,\Omega}^* &\leq C(\epsilon)|u|_{0,\Omega} + \epsilon[u]_{2,\alpha,\Omega}^* \end{aligned}$$

for  $j = 0, 1, 2$ ,  $0 \leq \alpha, \beta \leq 1$  and  $j + \beta \leq 2 + \alpha$ .

[More generally, we can think of inequalities in the following setting : Suppose we have an inequality of form  $\|u\|_{B_1} \lesssim \|u\|_{B_0}^\theta \|u\|_{B_2}^{1-\theta}$ , where  $B_2 \subset B_1 \subset B_0$  are nested Banach spaces. Then

we have  $\|u\|_{B_2} \leq C_\epsilon \|u\|_{B_0} + \epsilon \|u\|_{B_2} + C \|f\|_X$ , so  $(1 - \epsilon) \|u\|_{B_2} \leq C(\epsilon) \|u\|_{B_0} + C \|f\|_X$  for small  $\epsilon$ .]

**Theorem 7.4)** If

$$Lu := \sum_{i,j=1}^d a^{ij}(x) \partial_{x_i x_j}^2 u + \sum_{i=1}^d b^i(x) \partial_{x_i} u + c(x)u = f$$

has a solution  $u \in C^2(\Omega)$  for  $f \in C^{0,\alpha}(\Omega)$  then under the following hypothesis

$$(H1) \quad |a^{ij}|_{0,\alpha,\Omega}^{(0)}, |b^i|_{0,\alpha,\Omega}^{(1)}, |c|_{0,\alpha,\Omega}^{(2)} \leq \Lambda, \quad \Lambda > 0$$

$$(H2) \quad a^{ij}(x) = a^{ji}(x), \quad \sum_{i,j=1}^d a^{ij}(x) \xi_i \xi_j > \lambda |\xi|^2$$

we have  $u \in C^{2,\alpha}(\Omega)$  and

$$|u|_{2,\alpha,\Omega}^* \leq C(|u|_{0,\Omega} + |f|_{\alpha,\Omega}^{(2)})$$

**proof)** First note that by **Lemma 2**, it suffices to just prove  $[\partial_{ij}^2 u]_{0,\alpha,\Omega}^* \leq C(|u|_{0,\Omega} + |f|_{\alpha,\Omega}^{(2)})$ .

Main idea of the proof is to use estimates for the constant-coefficient case. Freeze the operator  $L$  at some point  $x_0 \in \Omega$  by taking

$$\begin{aligned} L_0 u &= \sum_{i,j=1}^d a^{ij}(x_0) \partial_{x_i x_j}^2 u \\ &= - \sum_{i,j=1}^d (a^{ij}(x_0) - a^{ij}(x)) u + \sum_{i=1}^d b^i \partial_{x_i} u + c(x)u + f =: F(x) \end{aligned}$$

so we have  $L_0 u = F(x)$  in  $\Omega$ .

We want to use interpolation argument. Let  $x_0, y_0 \in \Omega$  be fixed, and without loss of generality, assume  $d_{x_0, y_0} = \min\{d(x_0, \partial\Omega), d(y_0, \partial\Omega)\} = d_{x_0}$  and  $y_0 \in B(x_0, R) \subset \Omega$ . We introduce a parameter  $\mu \in (0, \frac{1}{2}]$  that would be specified later, and put  $\delta = \mu d_{x_0}$ .

In case  $y_0 \in B(x_0, \frac{\delta}{2})$ , interior Schauder estimate (**Proposition 7.2.**) for  $L_0 u = F$  gives

$$\begin{aligned} \left(\frac{\delta}{2}\right)^{2+\alpha} \frac{|\partial_{x_i x_j}^2 u(x_0) - \partial_{x_i x_j}^2 u(y_0)|}{|x_0 - y_0|^\alpha} &\leq C(|u|_{0,B} + |F|_{0,\alpha,B}^{(2)}) \\ \Leftrightarrow d_{x_0}^{2+\alpha} \frac{|\partial_{x_i x_j}^2 u(x_0) - \partial_{x_i x_j}^2 u(y_0)|}{|x_0 - y_0|^\alpha} &\leq \frac{C}{\mu^{2+\alpha}}(|u|_{0,B} + |F|_{0,\alpha,B}^{(2)}), \quad \forall y_0 \in B(x_0, \delta/2) \end{aligned}$$

and in case  $|x_0 - y_0| \geq \delta/2$ , since  $d_{x_0} \leq d_{y_0}$ ,

$$d_{x_0}^{2+\alpha} \frac{|\partial_{x_i x_j}^2 u(x_0) - \partial_{x_i x_j}^2 u(y_0)|}{|x_0 - y_0|^\alpha} \leq \left(\frac{2}{\mu}\right)^\alpha \left(d_{x_0}^2 |\partial_{x_i x_j}^2 u(x_0)| + d_{y_0}^2 |\partial_{x_i x_j}^2 u(y_0)|\right) \leq \frac{4}{\mu} [u]_{2,\Omega}^*$$

where the last inequality follows because  $2^\alpha \leq 2$ . So for any  $y_0 \in B(x_0, R)$ , combination of these two inequalities give

$$d_{x_0}^{2+\alpha} \frac{|\partial_{x_i x_j}^2 u(x_0) - \partial_{x_i x_j}^2 u(y_0)|}{|x_0 - y_0|^\alpha} \leq \frac{C}{\mu^{1+\alpha}}(|u|_{0,\alpha} + |F|_{0,\alpha,B}^{(2)}) + \frac{4}{\mu^\alpha} [u]_{2,\Omega}^* \quad \forall y_0 \in \Omega$$

The goal is now to estimate  $|F|_{0,\alpha,B}^{(2)}$ , keeping track of  $\mu$  - we want to make bound for which  $(4/\mu^\alpha)$  is sufficiently small so that we can pass this to the LHS which  $|F|_{0,\alpha,B}^{(2)}$  satisfies a reasonable bound.

In terms of norms of  $u$ ,  $|F|_{0,\alpha,B}^{(2)}$  can be written as

$$|F|_{0,\alpha,B}^{(2)} \leq \sum_{i,j=1}^d |(a^{ij}(x_0) - a^{ij}(x)) \partial_{x_i x_j}^2 u|_{0,\alpha,B}^{(2)} + \sum_{i=1}^d |b^i(x) \partial_{x_i} x|_{0,\alpha,B}^{(2)} + |cu|_{0,\alpha,B}^{(2)} + |f|_{0,\alpha,B}^{(2)}$$

We will estimate each term separately.

a. By **Lemma 1**,

$$\left| (a^{ij}(x_0) - a^{ij}(x)) \partial_{x_i x_j}^2 u \right|_{0,\alpha,B}^{(2)} \leq |a^{ij}(x_0) - a^{ij}(x)|_{0,\alpha,B}^{(0)} |\partial_{x_i x_j}^2 u|_{0,\alpha,B}^{(2)}$$

Here,

$$\begin{aligned} |a^{ij}(x_0) - a^{ij}(x)|_{0,\alpha,B}^{(0)} &\leq \sup_B |a^{ij}(x_0) - a^{ij}(x)| + \delta^\alpha [a^{ij}]_{\alpha,B} \\ &\leq 2\delta^\alpha [a^{ij}]_{\alpha,B} \leq 2^{1+\alpha} \mu^\alpha [a^{ij}]_{0,\alpha,\Omega}^* \\ &\leq 4\Lambda \mu^\alpha \end{aligned}$$

We make a remark to make further estimate :

*Remark :* By our choice of  $\mu$ ,  $d_{x_0} = \text{dist}(x_0, \partial\Omega) > (1 - \mu)d_{x_0} > \frac{1}{2}d_{x_0}$ , and recalling  $\delta = \mu d_{x_0}$ ,

$$\begin{aligned} |g|_{0,\alpha,B}^{(2)} &\leq \delta^2 |g|_{0,\alpha} + \delta^{2+\alpha} [g]_{\alpha,B} \\ &\leq \frac{\mu^2}{(1 - \mu)^2} [g]_{0,B}^{(2)} + \frac{\mu^{2+\alpha}}{(1 - \mu)^{2+\alpha}} [g]_{0,\alpha,B}^{(2)} \\ &\leq 4\mu^2 [g]_{0,\Omega}^{(2)} + 8\mu^{2+\alpha} [g]_{0,\alpha,\Omega} \leq 8\mu^2 |g|_{0,\alpha,\Omega}^{(2)} \end{aligned}$$

holds for any  $g \in C^\alpha(\Omega)$ .

Using the remark,

$$|\partial_{x_i x_j}^2 u|_{0,\alpha,B}^{(2)} \leq 4\mu^2 [u]_{2,B}^* + 8\mu^{2+\alpha} [u]_{2,\alpha,B}^*$$

so

$$\begin{aligned} \sum_{i,j=1}^d |(a^{ij}(x_0) - a^{ij}(x)) \partial_{x_i x_j}^2 u|_{0,\alpha,B}^{(2)} &\leq 32\delta^2 \Lambda \mu^{2+\alpha} ([u]_{2,B}^* + \mu^\alpha [u]_{2,\alpha,\Omega}^*) \\ &\leq 32\delta^2 \Lambda \mu^{2+\alpha} (C(\mu) |u|_{0,\Omega} + 2\mu^\alpha [u]_{2,\alpha,\Omega}^*) \end{aligned}$$

where we applied **Lemma 2** with  $\epsilon = \mu^\alpha$  in the last inequality.

b. For each  $i = 1, \dots, d$ , by the remark above,

$$\begin{aligned} |b^i \partial_{x_i} u|_{0,\alpha,B}^{(2)} &\leq 8\mu^2 |b^i Du|_{0,\alpha,\Omega}^{(1)} \\ &\leq 8\mu^2 |b^i|_{0,\alpha,\Omega}^{(1)} \quad (\text{Lemma 1}) \\ &\leq 8\mu^2 \Lambda |u|_{1,\alpha,\Omega}^* \\ &\leq 8\mu^2 \Lambda \mu^2 (|u|_{0,\Omega} + \mu^{2\alpha} [u]_{2,\alpha,\Omega}^*) \quad (\text{Lemma 2 with } \epsilon = \mu^{2\alpha}) \\ \Rightarrow \sum_{i=1}^d |b^i \partial_{x_i} u|_{0,\alpha,B}^{(2)} &\leq 8d\Lambda \mu^2 (|u|_{0,\Omega} + \mu^{2\alpha} [u]_{2,\alpha,\Omega}^*) \end{aligned}$$

by **Lemma 2**.

c. For  $c$ ,

$$|cu|_{0,\alpha,B}^{(2)} \leq 8\mu^2 |c|_{0,\alpha,\Omega}^{(2)} |u|_{0,\alpha,\Omega}^{(0)} \leq 8\Lambda\mu^2 (C(\mu)|u|_{0,\Omega} + \mu^{2\alpha}[u]_{2,\alpha,\Omega}^*)$$

by **Lemma 2** with  $\epsilon = \mu^{2\alpha}$ .

d. Finally,

$$|f|_{0,\alpha,B}^{(2)} \leq 8\mu^2 |f|_{0,\alpha,\Omega}^{(2)}$$

*Conclusion :*

$$|F|_{0,\alpha,B}^{(2)} \leq C\mu^{2+2\alpha}[u]_{2,\alpha,\Omega}^* + C(\mu)(|u|_{0,\Omega} + |f|_{0,\alpha,\Omega}^{(2)})$$

where  $C(\mu)$  depends on  $d, \alpha, \lambda, \Lambda$ . Now applying **Lemma 2** on  $[u]_{0,\alpha,B}^*$  with  $\epsilon = \mu^{2\alpha}/4$  gives

$$\frac{4}{\mu^\alpha}[u]_{2,\Omega}^* \leq \frac{C}{\mu^\alpha}|u|_{0,\Omega} + \mu^\alpha[u]_{2,\alpha,\Omega}^*$$

and therefore putting all these results together, we obtain

$$d_{x_0}^{2+\alpha} \frac{|\partial_{x_i x_j}^2 u(x_0) - \partial_{x_i x_j}^2 u(y_0)|}{|x_0 - y_0|^\alpha} \leq C\mu^\alpha[u]_{2,\alpha,\Omega}^* + C(\mu)(|u|_{0,\Omega} + |f|_{0,\alpha,\Omega}^{(2)})$$

(Be aware, that the first  $C$  does not depend on  $\mu$ ) This is true for any choice of  $x_0, y_0 \in \Omega$ , so

$$[u]_{2,\alpha,\Omega}^* \leq C(d, \alpha, \lambda, \Lambda)\mu^\alpha[u]_{2,\alpha,\Omega}^* + C(\mu)(|u|_{0,\Omega} + |f|_{0,\alpha,\Omega}^{(2)})$$

Choose  $C(d, \alpha, \lambda, \Lambda)\mu^\alpha < \frac{1}{2}$ , then we have

$$[u]_{2,\alpha,\Omega}^* \leq \frac{C(\mu)}{(1 - C\mu^\alpha)}(|u|_{0,\Omega} + |f|_{0,\alpha,\Omega}^{(2)})$$

(End of proof)  $\square$

(5th February, Tuesday)

Goal : to prove global Hölder  $(C^{2,\alpha})$  for any  $u \in C^2(\Omega) \cap C^0(\overline{\Omega})$  satisfying  $Lu = f$  in  $\Omega$ ,  $u = \varphi$  on  $\partial\Omega$ .

Recall our hypothesis, for  $L = \sum a^{ij}\partial_i\partial_j + \sum b^i\partial_i + c$ ,

$$(H1) \quad |a^{ij}|_{0,\alpha,\Omega}^{(0)}, |b^i|_{0,\alpha,\Omega}^{(1)}, |c|_{0,\alpha,\Omega}^{(2)} \leq \Lambda, \quad \Lambda > 0$$

$$(H2) \quad a^{ij}(x) = a^{ji}(x), \quad \sum_{i,j=1}^d a^{ij}(x)\xi_i\xi_j > \lambda|\xi|^2$$

and

$$(H) \quad a^{ij}, b^i, c \text{ are Hölder continuous, } a^{ij} = a^{ji}, a \text{ is uniformly elliptic, with parameter } \lambda$$

(when do we consider H1???)

## Interior Hölder estimate

**Corollary)** Under (H1) and (H2), the solution of  $Lu = f$  satisfies that  $\forall \Omega' \subset\subset \Omega$ ,

$$\delta |\nabla u|_{0,\Omega'} + \delta^2 |D^2 u|_{0,\Omega'} + \delta^{2+\alpha} [\partial^2 u]_{\alpha,\Omega'} \leq C(|u|_{0,\Omega} + |f|_{0,\alpha,\Omega})$$

for  $C = C(d, \alpha, \lambda, \Lambda, \Omega)$  and  $\delta = \text{dist}(\Omega', \partial\Omega)$ .

## Boundary and Global estimates

**Definition)** (*Domains of class  $C^{2,\alpha}$* ) A domain  $\Omega \subset \mathbb{R}^d$  is of **class  $C^{k,\alpha}$** ,  $0 \leq \alpha \leq 1$  if  $\forall x_0 \in \partial\Omega$ ,  $\exists B = B(x_0, r)$ ,  $r > 0$  and a diffeomorphism  $\psi : B(x_0, r) \rightarrow D \subset \mathbb{R}^d$  such that

$$(1) \quad \psi(B \cap \Omega) \subset \mathbb{R}_+^d = \{(z_1, \dots, z_d) \in \mathbb{R}^d : z_d \geq 0\}.$$

$$(2) \quad \psi(B \cap \partial\Omega) \subset \partial\mathbb{R}_+^d.$$

$$(3) \quad \psi \in C^{k,\alpha}(B), \psi^{-1} \in C^{k,\alpha}(D)$$

**Definition)**  $\Omega$  has a **boundary portion**  $T \subset \partial\Omega$  of class  $C^{k,\alpha}$  if  $\forall x_0 \in T$ ,  $\exists B = B(x_0, r)$  such that (1), (2), (3) are satisfied for some  $\psi$  defined above.

The key point in the proof of Hölder interior was to use *Interpolation Estimates*. This would be the same in boundary estimates and global estimates.

**Lemma 8.1)** (*Interpolation estimates on the boundary*) Let  $\Omega \subset \mathbb{R}_+^d$  open in  $\mathbb{R}_+^d$  with a boundary portion  $T$  on  $\{x_d = 0\}$ . Assume  $u \in C^{2,\alpha}(\Omega \cup T)$ . Then  $\forall \epsilon > 0$ ,

$$\begin{aligned} [u]_{j,\beta,\Omega \cup T}^* &\leq C_\epsilon |u|_{0,\Omega} + \epsilon [u]_{2,\alpha,\Omega \cup T}^*, \\ |u|_{j,\beta,\Omega \cup T}^* &\leq C_\epsilon |u|_{0,\Omega} + \epsilon [u]_{2,\alpha,\Omega \cup T}^*, \quad \forall \alpha \in [0, 1], \quad j + \beta < 2 + \alpha \end{aligned}$$

**Lemma 8.2)** Let  $\Omega \subset \mathbb{R}_+^d$ ,  $T$  boundary portion, and  $u \in C^2(\Omega \cup T)$  bounded solution of  $Lu = f$  and  $u = 0$  on  $T$  under hypothesis (H1) and (H2) on  $\Omega \cup T$  and  $f \in C^{0,\alpha}(\Omega \cup T)$ . Then

$$|u|_{2,\alpha,\Omega \cup T}^* \leq C(|u|_{0,\Omega} + |f|_{0,\alpha,\Omega \cup T}^{(2)})$$

for  $C = C(d, \alpha, \lambda, \Lambda)$ .

**proof)** The proof is almost the same as **Theorem 7.4**.

**Next step :** come back to  $\partial\Omega$  positively curved.

**Definition)** (*Norms  $(|\cdot|_*)$  near the boundary  $\Omega \subset \mathbb{R}^d$  with a boundary portion  $T$* ) Let  $x, y \in \Omega$ ,  $\bar{d}_x := \text{dist}(x, \partial\Omega \setminus T)$ ,  $\bar{d}_{x,y} = \min(\bar{d}_x, \bar{d}_y)$ . Define

$$\begin{aligned} [u]_{k,\alpha,\Omega \cup T}^* &= \sup_{|\beta|=k} \sup_{x,y \in \Omega} \frac{|\partial^\beta u(x) - \partial^\beta u(y)|}{|x - y|^\alpha} (\bar{d}_{x,y}^{k+\alpha}) \\ |u|_{k,\alpha,\Omega \cup T}^* &= |u|_{k,\Omega \cup T}^* + [u]_{k,\alpha,\Omega \cup T}^* \end{aligned}$$

where  $|u|_{k,\Omega \cup T}^* := |u|_{k,0,\alpha,\Omega \cup T}^*$ .

### Curved boundaries of Class $C^{k,\alpha}$

Consider  $\psi : \Omega \rightarrow \Omega'$ ,  $C|x - y| \leq |\psi(x) - \psi(y)| \leq \tilde{C}(x - y)$ . Make change of variable  $u(x) = \tilde{u}(x') = \tilde{u}(\psi(x))$  then we would have

$$\begin{aligned} C|u(x)|_{j,\beta,\Omega} &\lesssim |u'(x')|_{j,\beta,\Omega'} \lesssim \tilde{C}|u(x)|_{j,\beta,\Omega} \\ C|u(x)|_{j,\beta,\Omega \cup T} &\lesssim |\tilde{u}(x')|_{j,\beta,\Omega' \cup T'} \lesssim \tilde{C}|u(x)|_{j,\beta,\Omega \cup T}^* \\ C|u(x)|_{0,\beta,\Omega \cup T}^{(\sigma)} &\lesssim |\tilde{u}(x)|_{0,\beta,\Omega' \cup T'}^{(\sigma)} \lesssim \tilde{C}|u(x)|_{0,\beta,\Omega \cup T}^{(\sigma)} \end{aligned}$$

by chain rule.

**Lemma 8.3** Let  $\Omega$  be a bounded domain of class  $C^{2,\alpha}$  in  $\mathbb{R}^d$ ,  $u \in C^{2,\alpha}(\bar{\Omega})$  satisfies  $Lu = f$  in  $\Omega$ ,  $u = 0$  on  $\partial\Omega$  where  $f \in C^{0,\alpha}(\bar{\Omega})$  and  $L$  satisfies (H2) and

$$|a^{ij}|_{0,\alpha,\Omega}, |b^i|_{0,\alpha,\Omega}, |c|_{0,\alpha,\Omega} \leq \Lambda.$$

Then we have, for some  $\delta > 0$  not depending  $x_0$  such that

$$|u|_{2,\alpha,\Omega \cap B(x_0,\delta)} \leq C(|u|_{0,\Omega} + |f|_{0,\alpha,\Omega}), \quad \forall x_0 \in \partial\Omega$$

for  $C = C(d, \alpha, \lambda, \Lambda, \Omega)$  but not depending on  $x_0$ .

**proof**) Let  $x_0 \in \partial\Omega$ ,  $\psi$  be a diffeomorphism that flattens the boundary portion of  $\Omega$  near  $x_0$  and  $B(x_0, \rho)$  be the boundary portion.  $B' = B(x_0, \rho) \cap \Omega$ . After change of variables using  $\psi$ ,  $\tilde{u}(y) = u(x)$ ,  $y = \psi(x)$ . Then we may write, using chain rule, that

$$\begin{aligned} \tilde{L}\tilde{u} &= \sum_{i,j=1}^n \tilde{a}^{ij} \partial_{y_i y_j}^\alpha \tilde{u} + \sum \tilde{b}^i \partial_{x_i} u + \tilde{c} \tilde{u}(y) = \tilde{f} \\ \tilde{a}^{ij}(y) &= \frac{\partial_i \psi_i}{\partial x_r} \frac{\partial_j \psi_j}{\partial x_s} a^{rs}(x) \end{aligned}$$

and similarly for  $b$  and  $c$ . Then  $\tilde{a}$  would satisfy a uniform ellipticity condition with parameter  $\tilde{\Lambda}$  and

$$|\tilde{a}^{ij}|_{0,\alpha,D'}, |\tilde{b}^i|_{0,\alpha,D'}, |\tilde{c}|_{0,\alpha,D'} \leq \tilde{\Lambda}$$

So using **Lemma 8.2**,

$$|u|_{2,\alpha,D' \cup T'}^* \leq C(|\tilde{u}|_{0,D'} + |\tilde{f}|_{0,\alpha,D' \cup T'}^{(2)})$$

and so

$$|u|_{2,\alpha,B \cup T}^* \leq C(|u|_{0,B'} + |f|_{0,\alpha,B \cup T}) \leq C(|u|_{0,\Omega} + |f|_{0,\alpha,\Omega})$$

Now using compactness of  $\Omega$ , we can pick a constant  $C$  that applies uniformly on the boundary points  $x_0 \in \partial\Omega$ .

(End of proof)  $\square$

To produce Hölder interior estimate for  $\Omega' \subset\subset \Omega$ , choose  $\sigma = \delta$  of **Lemma 8.3** and let  $\Omega_\sigma = \{x \in \Omega : \text{dist}(x, \partial\Omega) > \sigma\}$ . For  $x, y \in \Omega$ , there are three possibilities :

- (1)  $x, y \in \Omega_\sigma$ , then interior Hölder inequality applies
- (2)  $x, y \in B(x, \delta)$ , then boundary Hölder inequality applies.

(3) For a boundary point  $x_j$ ,  $x \in \Omega_\sigma$ ,  $y \in B_{x_j, \rho}$  or  $x \in B(x_j, \rho)$ ,  $y \in B(x_j, \rho)$  then

$$\frac{|\partial_x^2 u(x) - \partial^2 u(y)|}{|x - y|^\alpha} \leq \frac{1}{\sigma^\alpha} (|\partial^2 u(x)| + |\partial^2 u(y)|) \leq C(|u|_0 + |f|_{0, \alpha})$$

(9th February, Saturday)

We had interior estimate in  $C^{1, \alpha}$  and boundary estimates in  $C^{2, \alpha}$ . If  $L = \sum a^{ij}(x) \partial_{x_i} \partial_{x_j} + \sum b^i(x) \partial_{x_i} + c(x)$ , is uniformly elliptic,  $a^{ij} = a^{ji}$  and  $|a^{ij}|_{0, \alpha, \Omega}, |b^i|_{0, \alpha, \Omega}, |c|_{0, \alpha, \Omega} < \Lambda$ , then we have :

**Lemma A** (*Interior estimate*) If  $Lu = f$  with  $u \in C^2(\Omega) \cap C^0(\overline{\Omega})$ ,  $f \in C^{0, \alpha}(\Omega)$ , then for all  $\Omega' \subset\subset \Omega$ ,  $\Omega'$  open, has

$$|u|_{2, \alpha, \Omega'}^* \leq C(|f|_{0, \alpha, \Omega} + |u|_{0, \Omega})$$

where  $C = C(d, \alpha, \lambda, \Lambda, \Omega)$ .

**Corollary** Fix  $\Omega' \subset\subset \Omega$  and let  $\delta := \text{dist}(\Omega', \partial\Omega)$ . Then we have

$$\delta |\nabla u|_{0, \Omega'} + \delta^2 |D^2 u|_{0, \Omega'} + \delta^{2+\alpha} [D^2 u]_{\alpha, \Omega'} \leq C(|u|_{0, \Omega} + |f|_{0, \alpha, \Omega})$$

where  $C$  is independent of  $\delta$ .

**Lemma B** (*Boundary estimate*) Let  $\Omega$  has  $C^{2, \alpha}$  boundary, bounded,  $f \in C^{0, \alpha}(\overline{\Omega})$ . If  $u \in C^2(\Omega) \cap C^0(\overline{\Omega})$  satisfies  $Lu = f$  in  $\Omega$ ,  $u = 0$  on  $\partial\Omega$  then  $\exists \delta = \delta(\partial\Omega) > 0$  such that  $\forall x_0 \in \partial\Omega$  and  $B_0 = B(x_0, \delta(\partial\Omega))$ , we have

$$|u|_{2, \alpha, B_0 \cap \Omega} \leq C(|u|_{0, \Omega} + |f|_{0, \alpha, \Omega})$$

We had  $\delta = \delta(\partial\Omega)$  uniform using compactness argument.

With these in hand, we prove *global estimates*, or *patching estimates*

**Theorem** (*Global estimates*) Let  $\Omega$  has  $C^{2, \alpha}$  boundary and *bounded*,  $f \in C^{0, \alpha}(\overline{\Omega})$  and  $u \in C^{2, \alpha}(\overline{\Omega})$  satisfies  $Lu = f$  in  $\Omega$ ,  $u = \varphi$  on  $\partial\Omega$  with  $\varphi \in C^{2, \alpha}(\Omega)$ . Then there is  $C > 0$  such that

$$|u|_{2, \alpha, \Omega} \leq C(|u|_{0, \Omega} + |\varphi|_{2, \alpha, \Omega} + |f|_{0, \alpha, \Omega})$$

where  $C = C(d, \alpha, \lambda, \Lambda, \Omega) > 0$ .

**proof** We can assume we are in the homogeneous case. Indeed, if we have  $Lv = f$  in  $\Omega$ ,  $v = \varphi$  on  $\Omega$ , then we may let  $u = v - \varphi$  so that  $Lu = f - L\varphi$  in  $\Omega$  and  $u = 0$  on  $\partial\Omega$ , *i.e.*  $u$  solves the homogeneous problem. If we can prove  $|u|_{2, \alpha, \Omega} \leq C(|u|_{0, \Omega} + |f|_{0, \alpha, \Omega})$ , then by triangular inequality, we have  $|v|_{2, \alpha, \Omega} \leq \tilde{C}(|f|_{0, \alpha, \Omega} + |\varphi|_{2, \alpha, \Omega} + |v|_{0, \Omega})$  so we recover the estimate for the general case.

We have by definition  $|u|_{2, \alpha, \Omega} = |u|_{2, 0, \Omega} + [\partial^2 u]_{0, \alpha, \Omega}$  where  $|u|_{2, 0, \Omega} = |u|_{0, \Omega} + \sum_{i=1}^d |\partial_{x_i} u|_{0, \Omega} + \sum_{i, j=1}^d |\partial_{x_i} \partial_{x_j} u|_{0, \Omega}$  and  $[\partial^2 u]_{0, \alpha, \Omega} = \sup_{x, y \in \Omega} \frac{|\partial^2 u(x) - \partial^2 u(y)|}{|x - y|^\alpha}$ . Set  $\Omega_\sigma = \{x \in \Omega : \text{dist}(x, \partial\Omega) > \sigma\}$ , where  $\sigma = \delta(\partial\Omega)$  as in the *boundary estimate*.

**1st step** : estimate  $|u|_{2, 0, \Omega}$ . Take  $x \in \Omega$ ,

- (1) If  $x \in \Omega_\sigma$ , then  $|u|_{2,0,\Omega_\sigma} \leq C(\sigma)(|u|_{0,\Omega} + |f|_{0,\alpha,\Omega})$  by *interior estimate*.
- (2) If  $x \in \Omega \setminus \Omega_\sigma$ , then set  $\Omega' = \Omega_\sigma$  in the *boundary estimate*. There exists  $x_0 \in \partial\Omega$ , and  $\delta > 0$  with  $|u|_{2,0,B(x_0,\delta)} \leq C(|f|_{0,\alpha} + |u|_{0,\Omega})$ .

**2nd step :** estimate Hölder part. Fix  $x, y \in \Omega$ .

- (1) If  $x, y \in \Omega_\sigma$ , then apply *interior estimate* applies.
- (2) If  $x, y \in \Omega \setminus \Omega_\sigma$  with  $x, y \in B(x_0, \sigma)$ , then *boundary estimate* applies.
- (3) If  $x, y \in \Omega \setminus \Omega_\sigma$  with  $x \in B(x_0, \sigma)$  and  $y \in B(x'_0, \sigma)$ , then has  $|x - y|^\alpha > (\sigma/2)^\alpha$  so

$$\frac{|\partial^2 u(x) - \partial^2 u(y)|}{|x - y|^\alpha} \leq \frac{2^\alpha}{\sigma^\alpha} (|\partial^2 u(x)| + |\partial^2 u(y)|) \leq 2 \left(\frac{2}{\sigma}\right)^\alpha |u|_{2,0,\Omega} \leq C(\sigma)(|f|_{0,\alpha,\Omega} + |u|_{0,\Omega})$$

So putting these together, we have the global estimate.

(End of proof)  $\square$

## Existence of Classical solutions

We have proved existence of solution to Poisson equation using Perron's method. We prove analogous result for elliptic partial differential equations.

**Theorem)** Let  $L$  be elliptic satisfying (H) and  $c(x) \leq 0$ . Let  $\Omega$  satisfy the exterior sphere condition (i.e.  $\forall x_0 \in \partial\Omega, \exists B \subset \mathbb{R}^d \setminus \Omega$ , a ball, such that  $B \cap \bar{\Omega} = \{x_0\}$ ). Assume  $f \in C^{0,\alpha}(\bar{\Omega})$  and  $\varphi \in C^0(\partial\Omega)$ . Then the Dirichlet problem  $Lu = f$  in  $\Omega$  and  $u = \varphi$  on  $\partial\Omega$  has a unique classical solution  $u \in C^0(\bar{\Omega}) \cap C^{2,\alpha}(\Omega)$ .

[a difference with the previous result is that we do not have  $u \in C^{2,\alpha}(\bar{\Omega})$  any more - so we do not have linear bound of  $u$  in terms of  $f$  and  $\varphi$ . -¿ what does this mean??]

**proof)** Proof to be done in the Example Sheet. But the idea is similar to that of Poisson equation.

- First see solvability in balls - idea of harmonic lifting applies again.
- Use maximum principles for  $Lu \geq 0$  (or  $\leq 0$ ) (to be done in next lecture)
- Use compactness of solutions of  $Lu = f$ , that is a consequence of interior estimate.

Next lecture, we will see maximum principle for elliptic operators. This allows us to prove the theorem and furthermore to make excursion to non-linear world - some examples are (1)  $-\Delta u = f(u)$ , (2)  $\det(D^2\Phi) = f(\phi, \nabla\phi)$  (Monge -Ampère), and (3)  $\operatorname{div}\left(\frac{\nabla u}{\sqrt{1+|\nabla u|^2}}\right) = f(u)$  - we do not have general explicit solution for these equations, but we can make various estimates based on maximum principle.

---

(12th February, Tuesday)

## Weak/Strong Maximum Principles for $Lu = f$

As usual,  $Lu = \sum a^{ij} \partial_{x_i x_j}^2 u + \sum b^i \partial_{x_i} u + c(x)u = f$  in  $\Omega$ ,  $u = \varphi$  on  $\partial\Omega$ .

To establish maximum principle, we need to make strong restriction on  $c$ , e.g. the equation  $\Delta u + cu = 0$  has exponential growing solution if  $c \neq 0$ , so we do not have any hope of making a good bound.

**Theorem)** Let  $L$  be (not necessarily uniform) elliptic (that is,  $a^{ij}(x)\xi_i\xi_j \geq \lambda(x)|\xi|^2$ ),  $c = 0$  in  $\Omega$  and  $u \in C^2(\Omega) \cap C^0(\overline{\Omega})$  with  $Lu \geq 0$  in  $\Omega$  and  $\beta(x) := \frac{\sup_{i=1,\dots,d} |b^i(x)|}{\lambda(x)} \leq \beta$  for all  $x \in \Omega$  (recall,  $\lambda$  is the ellipticity constant.) Then

$$\sup_{\Omega} u = \sup_{\partial\Omega} u$$

**proof) 1st step :** Assume  $Lu > 0$  in  $\Omega$ , and assume  $\exists z_0 \in \Omega$  such that  $u(z_0) = \sup_{x \in \Omega} u(x)$ . Then we should have  $\nabla u(z_0) = 0$  and  $D^2 u(z_0) \leq 0$ . By ellipticity, we have

$$Lu(z_0) = \sum_{i,j=1}^d a^{ij}(z_0) \partial_{x_i x_j}^2 u(z_0) + \sum b^i \partial_{x_i} u \leq 0.$$

which is a contradiction.

**2nd step :** In general, has  $Lu \geq 0$ . We want to construct a function that satisfies the strict inequality  $Lg > 0$ , called *maximizing function*. A reasonable choice for this would be the exponential function - consider  $e^{\gamma x_1}$ , for  $\gamma$  a parameter to be chosen, and without loss of generality, say  $a_{11}(x) \geq \lambda(x)$ . Then

$$\begin{aligned} Le^{\gamma x_1} &= (\gamma^2 a^{11}(x) + \gamma b^1(x)) e^{\gamma x_1} \\ &\geq (\gamma^2 a^{11}(x) - \gamma \lambda \beta) e^{\gamma x_1} \geq \gamma \lambda (\gamma - \beta) e^{\gamma x_1} > c_0(x) > 0 \end{aligned}$$

for any  $\gamma \geq 2\beta$ . Let  $\epsilon > 0$ , then

$$L(u + \epsilon e^{\gamma x_1}) = Lu + \epsilon Le^{\gamma x_1} > 0$$

Apply the 1st part to  $L(u + \epsilon e^{\gamma x_1}) > 0$ , so for any  $\epsilon > 0$ , has

$$\sup_{\overline{\Omega}} (u + \epsilon e^{\gamma x_1}) = \sup_{\partial\Omega} (u + \epsilon e^{\gamma x_1})$$

Take  $\epsilon \rightarrow 0$  to conclude

$$\sup_{\overline{\Omega}} u = \sup_{\partial\Omega} u$$

(End of proof)  $\square$

**Theorem)** (*Strong maximum principle, E. Hopf*) We now let  $L$  be uniformly elliptic, say  $\sum_{i,j} a^{ij} \xi_i \xi_j \geq \lambda |\xi|^2$  with  $\lambda > 0$  uniform. Let  $u \in C^2(\Omega) \cap C^0(\overline{\Omega})$  satisfy  $Lu \geq 0$ , and assume  $\max_{z \in \overline{\Omega}} u(z) = u(z_0)$ . Then

- (1) If  $c = 0$  and  $z_0 \in \Omega$ , then  $u$  is constant.
- (2) If  $c \leq 0$ ,  $c/\lambda$  bounded, and  $u(z_0) \leq 0$  for some  $z_0 \in \Omega$ , then  $u$  is constant.

**Lemma** (*Hopf*) Let  $L$  be uniformly elliptic and  $Lu \geq 0$  in  $\Omega$ . Take  $x_0 \in \partial\Omega$  such that

- (i)  $u$  is continuous at  $x_0$ ,
- (ii)  $u(x_0) > u(x)$  for all  $x \in \Omega$ ,
- (iii)  $\partial\Omega$  satisfies the *interior sphere condition*.

Then,

- (1) if  $c = 0$ , then  $\frac{\partial u}{\partial n_x}(x_0) > 0$ ,
- (2) if  $c \leq 0$ ,  $c/\lambda$  is bounded and  $u(x_0) \geq 0$ , then  $\frac{\partial u}{\partial n_x}(x_0) \leq 0$ .

We prove the theorem assuming the lemma.

**proof of strong maximum principle**) We will prove by contradiction - assume that  $u$  is not constant. Let  $M = u(z_0) = \max_{x \in \bar{\Omega}} u(x)$  for  $z_0 \in \Omega$ . Also let  $\Omega^-$  be the *level set* defined by

$$\Omega^- = \{x \in \Omega : u(x) < M\} \subset \Omega$$

Then  $z_0 \in \Omega \setminus \Omega^-$  so  $\partial\Omega^- \cap \Omega \neq \emptyset$ . Let  $x_0 \in \Omega^-$  be such that  $\text{dist}(x_0, \partial\Omega^-) < \text{dist}(x_0, \partial\Omega)$ . Let  $r > 0$  be such that  $B(x_0, r)$  is maximal such that  $B(x_0, r) \subset \Omega^-$ . Then there is  $y \in \partial B(x_0, r)$  such that  $y \in \partial\Omega^-$ , so  $u(y) = M$ . But  $r$  is set to be maximal, so  $u(x_0 + (1 + \epsilon)(y - x_0)) = M$  for any sufficiently small  $\epsilon > 0$ , and in turn  $\frac{\partial u}{\partial n_x}(y) = 0$  where  $n_x$  is the normal direction at  $y$  outside from  $B(x_0, r)$ . But this is a contradiction to Hopf's lemma which states that  $\frac{\partial u}{\partial n_x}(y) > 0$ ,

(*End of proof*)  $\square$

A maximum principle in a different flavour :

**Theorem** (*Maximum principle, Alexandroff*) Let  $u \in C^0(\bar{\Omega}) \cap C^2(\Omega)$  be satisfying  $Lu \geq f$  in  $\Omega$  with  $\frac{|b(x)|}{D^*}, \frac{f(x)}{D^*} \in L^d(\Omega)$ ,  $c \leq 0$  in  $\Omega$ , where  $D^* := \det(A(x))^{1/d}$ . Then

$$\sup_{\Omega} u \leq \sup_{\partial\Omega} u^+ + c \left\| \frac{f^-}{D^*} \right\|_{L^d(\Gamma_+)}$$

for  $\Gamma_+ \subset \Omega$ .

(14th February, Thursday)

Recall, we used, but remains to be proved :

**Lemma** (*Hopf*) Let  $L$  be uniformly elliptic,  $Lu \geq 0$  in  $\Omega$ ,  $u \in C^2(\Omega)$ . Let  $x_0 \in \partial\Omega$  be such that

- (i)  $u$  is continuous at  $x_0$
- (ii)  $u(x_0) > u(x)$  for all  $x \in \Omega$
- (iii)  $\partial\Omega$  satisfy interior sphere condition at  $x_0$ .

Then

1. if  $c = 0$ , then  $\frac{\partial u}{\partial n_x} > 0$  (if it exists - in fact, one can prove a more general version of this statement)
2. if  $c \leq 0$  and  $c(x)/\lambda$  is bounded,  $u(x_0) < 0$  then  $\frac{\partial u}{\partial n_x}(x_0) > 0$ .

**proof**) Pick  $y$  and  $R$  with  $x_0 \in \partial B(y, R)$ . Let  $0 < \rho < R$ . Consider annuli of form  $A_\rho = B(y, R) \setminus B(y, \rho)$ . Introduce auxiliary function

$$v(x) = e^{-\alpha r^2} - e^{-\alpha R^2}, \quad r = |x - y| \in [\rho, R],$$

with  $\alpha$  to be chosen later. Then one has

$$Lv = e^{-\alpha r^2} \left( 4\alpha^{ii}(x_i - y_i)(x_j - y_j) - 2\alpha(a^{ii} + b^i(x_i - y_i)) \right) + cv$$

Take  $\alpha$  large enough,  $Lv \geq 0$ . As  $u - u(x_0) < 0$  on  $\partial B(y, \rho)$ , we may find  $\epsilon > 0$  such that  $u - u(x_0) + \epsilon v \leq 0$  on  $\partial B(y, \rho)$ , and since  $L(u - u(x_0) + \epsilon v) \geq 0$ , by *Weak Maximum Principle*, one has  $u - u(x_0) + \epsilon v \leq 0$  in  $A_\rho$ . Hence

$$\frac{\partial u}{\partial n_x}(x_0) \geq -\epsilon \frac{\partial v}{\partial n_x}(x_0) \geq -\epsilon v'(R) > 0$$

(can in fact replace  $\frac{\partial u}{\partial n_x}(x_0)$  with  $\liminf_{x \rightarrow x_0, x \in B} \frac{u(x_0) - u(x)}{|x_0 - x|}$ .)

(End of proof)  $\square$

### Alexandroff maximum principle

Suppose  $L = \sum_{ij} \partial_{x_i x_j}^2 + \sum_i b^i \partial_{x_i} + c(x)$  satisfies ellipticity condition (i.e.  $A = (a^{ij})_{i,j=1}^d$  positive definite in  $\Omega$ ) in  $\Omega$ . Define  $D(x) = \det(A(x))$ ,  $D^* = D^{1/d}$ , then

$$0 \leq \lambda(x) \leq D^*(x) \leq \Lambda(x)$$

where  $\lambda(x)$  is the minimum eigenvalue of  $A(x)$  and  $\Lambda(x)$  is the maximum eigenvalue of  $A(x)$ . Let  $u \in C^2(\Omega)$ , and  $\Gamma^+ = \{y \in \Omega : u(x) \leq u(y) + \nabla u(y)(x - y), \forall x \in \Omega\}$ , the **upper contact set of  $u$**

[Remark : Has  $D^2 u \leq 0$  on  $\Gamma^+$ . In particular,  $u$  is concave in  $\Omega$  iff  $\Gamma^+ = \Omega$ .]

**Theorem)** (Alexandroff) If  $\Omega \subset \mathbb{R}^n$ ,  $u \in C^2(\Omega) \cap C^0(\overline{\Omega})$ ,  $Lu \geq f$  in  $\Omega$  with  $\frac{|b|}{D^*}, \frac{f}{D^*} \in L^d(\Omega)$ ,  $c \leq 0$  in  $\Omega$ , then

$$\sup_{\Omega} u \leq \sup_{\partial\Omega} u^+ + C \left\| \frac{f^-}{D^*} \right\|_{L^d(\Gamma^+)}$$

for some constant  $C = C(d, \text{diam}(\Omega), \left\| \frac{b}{D^*} \right\|_{L^d(\Omega)})$ .

[A nice thing about this estimate is that  $f^-/D^*$  need not be Hölder in order to make this estimate - it can be something much weaker. Hence, this can be applied on functions that dependent on  $u$  in a non-linear fashion, which makes it possible to make estimates on non-linear equations.]

**Lemma)** Let  $g \in L^1_{loc}(\mathbb{R}^d)$ ,  $g \geq 0$ . Then  $\forall u \in C^0(\overline{\Omega}) \cap C^2(\Omega)$ , we have

$$\int_{B(0, \bar{u})} g(x) dx \leq \int_{\Gamma^+} g(\nabla u) |\det(D^2 u)| dx$$

for  $\tilde{u} = \frac{1}{\text{diam}(\Omega)}(\sup_{\overline{\Omega}} u - \sup_{\partial\Omega} u) \geq 0$ .

**Remark :**  $\forall x \in \Gamma^+$ ,

$$\det(D^2u(x)) \leq \frac{1}{D} \left( \frac{-a^{ij}(x)\partial_{x_i x_j}^2 u}{d} \right)^d$$

We first assume the lemma and prove the theorem.

**proof of the theorem)** For  $x \in \Omega^+ := \{x \in \Omega : u > 0\}$  and for some parameter  $\mu > 0$ ,

$$\begin{aligned} -a^{ij}\partial_{x_i x_j}^2 u(x) &\leq b^i \partial_{x_i} u + cu - f \leq |b||\nabla u| + f^- \\ &\leq \left( |b|^d + \frac{(f^-)^d}{\mu^d} \right)^{1/d} \left( |\nabla u|^d + \mu^d \right)^{1/d} \end{aligned}$$

where the last inequality follows from Hölder inequality. So

$$\left( a^{ij}\partial_{x_i x_j}^2 u \right)^d \leq \left( |b|^d + \frac{(f^-)^d}{\mu^d} \right) \left( |\nabla u|^d + \mu^d \right)$$

The previous lemma would be applied with carefully chosen  $g$ ,

$$g(p) = \frac{1}{|p|^d + \mu^d} \in L_{loc}^1(\mathbb{R}^d)$$

By the **Lemma** and the **Remark**, we have

$$\begin{aligned} \int_{B(0, \tilde{u})} g(x) dx &\leq \int_{\Gamma^+} |g(\nabla u)| |\det(D^2u)| dx \\ &\leq \int_{\Gamma^+} \frac{1}{|\nabla u|^d + \mu^d} \frac{1}{D} \left( |b|^d + \frac{f^-}{\mu^d} \right)^d \left( |\nabla u|^d + \mu^d \right) dx \end{aligned}$$

(recall,  $D(x) = \det(A(x))$ ) so

$$\int_{B(0, \tilde{u})} g(x) dx \leq \int_{\Gamma^+ \cap \Omega^+} \frac{1}{D} \left( |b|^d + \frac{(f^-)^d}{\mu^d} \right) dx$$

On the other hand,

$$\begin{aligned} \int_{B(0, \tilde{u})} g(x) dx &= \int_{B(0, \tilde{u})} \frac{dx}{|\nabla u|^d + \mu^d} = |w_d| \int_0^{\tilde{u}} \frac{r^{d-1}}{r^d + \mu^d} dr \\ &= \frac{|w_d|}{d} \log \left( \frac{\tilde{u}^d + \mu^d}{\mu^d} \right) = \frac{|w_d|}{d} \log \left( \frac{\tilde{u}^d}{\mu^d} + 1 \right) \end{aligned}$$

Putting two results together,

$$\log \left( \frac{\tilde{u}^d}{\mu^d} + 1 \right) \leq \frac{d}{|w_d|} \int_{\Gamma^+ \cap \Omega^+} \frac{1}{D} \left( |b|^d + \frac{(f^-)^d}{\mu^d} \right) dx$$

so

$$\frac{\tilde{u}^d}{\mu^d} + 1 \leq \exp \left( \frac{d}{|w_d|} \int_{\Gamma^+ \cap \Omega^+} \left( |b|^d + \frac{(f^-)^d}{D\mu^d} \right) dx \right)$$

Choose  $\mu = \left\| \frac{f^-}{D^*} \right\|_{L^d(\Gamma^+ \cap \Omega^+)}$ , then we are done.

(End of proof)  $\square$

## Semilinear equation

We will study one particular class of semilinear equations of form

$$\begin{cases} \Delta u = f(x, u) & x \in \Omega \\ u = 0 & x \in \partial\Omega \end{cases}$$

for some function  $f : \bar{\Omega} \times \mathbb{R} \rightarrow \mathbb{R}, (x, \xi) \mapsto f(x, \xi)$ . Here,  $f(x, u)$  makes non-linearity. Note that this has no contribution from  $\nabla u$  (we call those equations for which  $f$  depends on  $\nabla u$ , the quasilinear equations).

**Theorem)** Let  $\Omega$  be *bounded* and has  $C^{2,\alpha}$  boundary,  $f \in C^1(\bar{\Omega} \times \mathbb{R})$ . Assume that there are  $\underline{u}, \bar{u} \in C^{2,\alpha}(\bar{\Omega})$  satisfying

$$\begin{cases} \underline{u} \leq \bar{u} & \text{in } \Omega \\ \Delta \underline{u} \geq f(x, \underline{u}) & \text{in } \Omega, \quad \underline{u} \leq 0 \text{ on } \partial\Omega \\ \Delta \bar{u} \leq f(x, \bar{u}) & \text{in } \Omega, \quad \bar{u} \geq 0 \text{ on } \partial\Omega \end{cases}$$

Then there exists  $u \in C^{2,\alpha}(\bar{\Omega})$  such that  $\Delta u = f(x, u(x))$  in  $\Omega$ ,  $u = 0$  on  $\partial\Omega$  and  $\underline{u} \leq u \leq \bar{u}$  in  $\Omega$ . [This is called the method of sub- $\mathcal{E}$ -supersolutions]

**Idea :** Assume that we can construct  $(u_k) \subset C^{2,\alpha}(\bar{\Omega})$  such that  $\Delta u_{k+1} \simeq f(u_k)$  in  $\Omega$  using  $\underline{u}$  and  $\bar{u}$ . Assume that  $u_k \xrightarrow{k \rightarrow \infty} u_\infty \in C^{2,\alpha}(\bar{\Omega})$ . Then  $\Delta u_{k+1} \rightarrow \Delta u_\infty$  and  $f(u_k) \rightarrow f(u_\infty)$  so  $u_\infty$  would be the desired solution.

**proof)** Define

$$m = \inf_{x \in \Omega} \underline{u}(x), \quad M = \sup_{x \in \Omega} \bar{u}(x)$$

Take  $\lambda > 0$  large enough to that

$$\partial_\xi f(x, \xi) < \lambda, \quad \forall (x, \xi) \in \bar{\Omega} \times [m, M]$$

Define for  $k \in \mathbb{N}$ ,  $u_0 = \underline{u}$  and

$$\begin{cases} \Delta u_{k+1} - \lambda u_{k+1} = f(x, u_k) - \lambda u_k & \text{in } \Omega \\ u_{k+1} = 0 & \text{on } \Omega \end{cases} \dots\dots\dots (\star_{k+1})$$

The existence of such  $u_k$  is guaranteed from our previous works.

♠ **Claim :**  $\underline{u} \leq u_k \leq u_{k+1} \leq \bar{u}$  in  $\Omega$  for all  $k \in \mathbb{N}$ .

: The inequality  $\underline{u} \leq u_k$  true if  $k = 0$ , by definition. We proceed by induction.

Assume that  $u_{k-1} \leq u_k \leq \bar{u}$  in  $\Omega$ , with convention  $u_{-1} = \underline{u}$ . Consider  $u_{k+1}$  satisfying  $(\star_{k+1})$ . Then

$$\begin{aligned} \Delta(u_{k+1} - u_k) - \lambda(u_{k+1} - u_k) &\leq f(x, u_k) - f(x, u_{k-1}) - \lambda(u_k - u_{k-1}) \\ &\leq |f(x, u_k) - f(x, u_{k-1})| - \lambda(u_k - u_{k-1}) \\ &\leq -(\lambda - \partial_\xi f(x, \theta))(u_k - u_{k-1}) \quad \text{for some } \theta \\ &\leq 0 \end{aligned}$$

So we have

$$\begin{aligned}\Delta(u_{k+1} - u_k) - \lambda(u_{k+1} - u_k) &\leq 0 \\ u_{k+1} &\geq u_k \quad \text{on } \partial\Omega\end{aligned}$$

(Note that we always have  $u_{k+1} = u_k = 0$  on  $\partial\Omega$  whenever  $k \geq 1$ , and if  $k = 0$ , then  $u_1 = 0 \geq u_0$  on  $\partial\Omega$ ). So by maximum principle, we have  $u_{k+1} \geq u_k$  in  $\Omega$ .

Analogously, we also have  $u_{k+1} \leq \bar{u}$  in  $\Omega$ , which concludes the claim.

Also *elliptic regularity* (c.f. see **Theorem 6.3**), we have that  $\{u_k\}_k \subset C^{2,\alpha}(\bar{\Omega})$ ,  $u_k \leq u_{k+1}$  in  $\Omega$ , and bounded with  $m \leq u_k \leq M$ . Hence by *Arzelà-Ascoli Theorem*, we have  $u_\infty \in C^0(\bar{\Omega})$  such that  $u_k \rightarrow u_\infty$  in  $C^0(\bar{\Omega})$ , where the convergence is made upto a subsequence (but since  $u_k \leq u_{k+1} \leq \bar{u}$  for each  $k$ , we in fact do not have to take a subsequence).

Moreover, for  $k > l$ ,  $u_k - u_l$  satisfies the equation

$$\Delta(u_k - u_l) - \lambda(u_k - u_l) = f(x, u_{k-1}) - f(x, u_{l-1}) - \lambda(u_{k-1} - u_{l-1})$$

so *global Schauder estimate* gives

$$\begin{aligned}\|u_k - u_l\|_{2,0,\bar{\Omega}} &\leq C \left\| \left( f(\cdot, u_{k-1}(\cdot)) - f(\cdot, u_{l-1}(\cdot)) \right) - \lambda(u_{k-1} - u_{l-1}) \right\|_{0,0,\bar{\Omega}} \\ &\rightarrow 0 \quad \text{as } k, l \rightarrow \infty\end{aligned}$$

where we have used the fact that  $f$  should be  $\lambda$ -Lipschitz in the second component and uniformly continuous is the first component. Hence the convergence  $u_k \rightarrow u$  is in fact made in  $C^{2,0}(\bar{\Omega})$ . So we have

$$\begin{aligned}\Delta u_k &\rightarrow \Delta u_\infty \\ \Delta(u_k) - \lambda u_k &\rightarrow \Delta u_\infty - \lambda u_\infty \\ f(u_{k-1}) - \lambda u_{k-1} &\rightarrow f(u_\infty) - \lambda u_\infty\end{aligned}$$

and therefore  $\Delta u_\infty = f(x, u_\infty)$ . Applying *elliptic regularity* once more, we finally conclude that  $u \in C^{0,\alpha}(\bar{\Omega})$ .

[In the case  $\alpha > 0$ , if we use the following version of *Arzelà-Ascoli Theorem*, then the conclusion follows more easily after the Claim :

**Arzelà-Ascoli Theorem)** Let  $K \subset \mathbb{R}^d$  be a compact set and  $(f_n)_n \subset C^{m,\alpha}$  be such that

$$\sup_n \|f_n\|_{C^{m,\alpha}} = M < +\infty$$

Then there is a subsequence  $(n_k)_k \subset \mathbb{N}$  such that  $f_n \rightarrow f$  as  $n \rightarrow \infty$  in  $C^{m,\beta}$  for any  $\beta \in [0, \alpha)$  and  $f$  is in  $C^{m,\alpha}$ .

Once we have this, we just find a subsequence  $(u_{n_k})_k$  converging to  $u \in C^{2,\alpha}$  in any space  $C^{2,\beta}$ ,  $\beta < \alpha$ , then we have  $\Delta u = f(x, u)$  by the same argument.

In the case  $\alpha = 0$ , just follow the proof above.]

(End of proof)  $\square$

**Corollary)** Let  $\Omega \subset C^{2,\alpha}$  be bounded, and let  $f \in C^1(\bar{\Omega} \times \mathbb{R})$  and  $f$  is bounded. Then there exists a solution  $u \in C^{2,\alpha}(\bar{\Omega})$  of  $\Delta u = f(x, u)$  in  $\Omega$  and  $u = 0$  on  $\partial\Omega$ .

**proof)** Let  $\mathcal{M}_f = \sup_{\overline{\Omega} \times \mathbb{R}} |f| < \infty$ . Let  $\underline{u}, \overline{u} \in C^{2,\alpha}(\overline{\Omega})$  be defined by

$$\begin{cases} \Delta \underline{u} = \mathcal{M}_f & \text{in } \Omega \\ \underline{u} = 0 & \text{on } \partial\Omega \end{cases} \quad / \quad \begin{cases} \Delta \overline{u} = -\mathcal{M}_f & \text{in } \Omega \\ \overline{u} = 0 & \text{on } \partial\Omega \end{cases}$$

Then  $\mathcal{M}_f = \Delta \underline{u} = \Delta \overline{u} \geq -\mathcal{M}_f$ , so  $\Delta(\underline{u} - \overline{u}) \leq 0$  in  $\Omega$  and  $\underline{u} \leq \overline{u}$  on  $\partial\Omega$ . Hence by *maximum principle*,  $\underline{u} \leq \overline{u}$  in  $\overline{\Omega}$ . Also noting that

$$\begin{aligned} \mathcal{M}_f &= \Delta \underline{u} \geq f(x, \underline{u}) \\ -\mathcal{M}_f &= \Delta \overline{u} \leq f(x, \overline{u}) \end{aligned}$$

we see that we have constructed subsolution and supersolution pair  $\underline{u}$  and  $\overline{u}$ . We may now apply the previous theorem to conclude the proof.

(End of proof)  $\square$

*Remark :* Uniqueness of solutions has to be prove by different methods, and sometimes the uniqueness fails.

**Theorem)** (*Gidas, Ni & Nirenberg*) Let  $B = B(0, 1) \subset \mathbb{R}^d$ . Assume that  $u \in C^0(\overline{B}) \cap C^2(B)$  is a positive solution ( $u \geq 0$  on  $B$ ) of

$$\begin{cases} \Delta u + f(u) = 0 & \text{in } B \\ u = 0 & \text{on } \partial B \end{cases}$$

Assume that  $f$  is *locally Lipschitz* in  $\mathbb{R}$ . Then  $u$  is radially symmetric and

$$\frac{\partial u}{\partial r}(x) < 0 \quad \text{whenever } x \neq 0.$$

**Lemma)** (*Fanghua Lin & Qing Han*) Let  $\Omega$  a bounded (convex) domain in the  $x_1$ -direction and symmetric with respect to  $\{x_1 = 0\}$ . If  $u \in C^0(\overline{\Omega}) \cap C^2(\Omega)$  satisfies  $\Delta u + f(u) = 0$  in  $\Omega$  and  $u = 0$  on  $\partial\Omega$  with  $f$  *locally Lipschitz*. Assume that  $u > 0$  in  $\Omega$ , then  $u$  is symmetric with respect to  $x_1$  direction and

$$\frac{\partial u}{\partial x_1}(x) < 0 \quad \forall x \in \Omega, \quad x_1 > 0$$

(19th February, Tuesday)

To prove this result, we need more maximum principles, which have no dependence on the sign of  $c$  in the elliptic operator  $L = \sum a^{ij} \partial_{ij} + \sum b^i \partial_i + c$ .

**Theorem)** (*Varadhan, Maximum principle in narrow domains*) Consider  $Lu = \sum_{ij} a^{ij} \partial_{x_i x_j}^2 u + \sum_i b^i \partial_{x_i} u + c(x)u$ ,  $a^{ij}$  positive definite pointwise in  $\Omega$ ,  $|b^i| + |c| \leq \Lambda$ ,  $\det(a^{ij}(x)) \geq \lambda$ ,  $\delta := \text{diam}(\Omega) > 0$ . Assume  $u \in C^0(\overline{\Omega}) \cap C^2(\Omega)$  satisfies  $Lu \geq 0$  in  $\Omega$  and  $u \leq 0$  in  $\partial\Omega$ . Then  $\exists C_\delta = C_\delta(d, \Lambda, \lambda) > 0$  such that,

$$|\Omega| \leq C_\delta \quad \text{implies} \quad u \leq 0 \text{ in } \Omega.$$

where  $|\Omega|$  is the Lebesgue measure of  $\Omega$ . [*Remark : we do not need condition on sign of  $c$* ]

**proof)** If  $c \leq 0$ , then the result directly follows from *Alexandroff maximum principle* applied with  $f = 0$ .

If  $c > 0$ , make decomposition  $c = c^+ - c^-$ ,  $c^+, c^- \geq 0$ . Then  $Lu \geq 0$  entails

$$Lu - c^+(x)u = \sum a^{ij} \partial_{ij}^2 u + \sum b^i \partial_i u - c^-(x)u \geq -c^+(x)u$$

Applying *Alexandroff maximum principle* with  $f = -c^+(x)u$ , we obtain

$$\begin{aligned} \sup_{\Omega} u &\leq C \|c^+\|_{L^d(\Gamma^+ \cap \Omega^+)} \leq C \leq \|c^+\|_{L^\infty} |\Omega|^{1/d} \sup_{\Omega} |u| \\ &\leq \frac{1}{2} \sup_{\Omega} u \quad \text{given } |\Omega| \text{ small enough} \end{aligned}$$

So this implies  $u \leq 0$  in  $\Omega$ .

(End of proof)  $\square$

**Theorem)** (*Serrin, Comparison principle*) Suppose that  $u \in C^0(\overline{\Omega}) \cap C^2(\Omega)$  with  $Lu \geq 0$  in  $\Omega$  and  $u \leq 0$  in  $\Omega$  (not  $\partial\Omega$ , all of  $\Omega$ ), with  $L$  having continuous coefficients (no bounds necessary). Then

- either  $u < 0$  in  $\Omega$ ,
- or  $u \equiv 0$  in  $\Omega$ .

**proof)** Write  $c = c^+ - c^-$ ,  $Lu \geq 0$  implies

$$\sum a^{ij} \partial_{ij}^2 u + \sum b^i \partial_i u - c^- u \geq -c^+ u$$

but as  $u \leq 0$  in  $\Omega$ , has  $-c^+ u \geq 0$ . So if  $\exists x_0 \in \Omega$  such that  $u(x_0) = 0$ , then *strong maximum principle* tells us that  $u \equiv 0$ , and if not, we have  $u < 0$ .

(End of proof)  $\square$

**Lemma)** (*Fanghua Lin & Qing Han*) (See Section 2.6 of Han, Lin ([3])) Let  $\Omega$  a bounded convex domain in the  $x_1$ -direction and symmetric with respect to  $\{x_1 = 0\}$ . If  $u \in C^0(\overline{\Omega}) \cap C^2(\Omega)$  satisfies

$$\begin{cases} \Delta u + f(u) = 0 & \text{in } \Omega \\ u = 0 & \text{on } \partial\Omega. \end{cases}$$

with  $f$  locally Lipschitz. Assume that  $u > 0$  in  $\Omega$ , then  $u$  is symmetric with respect to  $x_1$  direction and

$$\frac{\partial u}{\partial x_1}(x) < 0 \quad \forall x \in \Omega, \quad x_1 > 0$$

**proof)** Since  $\Omega$  is bounded in  $x_1$ -direction, we may let  $\sup\{x_1 : x = (x_1, y) \in \Omega\} =: a$ . For any  $\lambda \in [0, a)$ , introduce

$$\Sigma_\lambda = \{x \in \Omega : x_1 > \lambda\}, \quad T_\lambda = \{x_1 = \lambda\}$$

$$\Sigma'_\lambda = \{x_\lambda : x \in \Sigma_\lambda\} \text{ where } x_\lambda \equiv (x_1, y)_\lambda = (2 - x_1, y) \text{ is the reflection of } x \text{ respect to } T_\lambda$$

and define

$$w_\lambda(x) = u(x) - u(x_\lambda), \quad x \in \Sigma_\lambda$$

Now make choice  $\lambda \in (0, a)$ . We want to prove that  $w_\lambda < 0$  in  $\Sigma_\lambda$ . Indeed, once we prove this, first we have  $u(x_1, y)$  decreasing in  $x_1$  and second  $u(x) \leq u(-x)$  for any  $x \in \Sigma_0$ , and by symmetry  $u(x) \geq u(-x)$ , so  $u(x) = u(-x)$ . We may want to use some sort of maximum principle to prove this, so we compute  $\Delta w_\lambda$ .

$$\Delta w_\lambda(x) = \Delta u(x) - \Delta u(x_\lambda) = f(u(x)) - f(u(x_\lambda)) = -c(x, \lambda)w_\lambda,$$

where  $c$  is some bounded function in  $\Sigma_\lambda$  exploiting *locally Lipschitz property* of  $f$ . So

$$\begin{cases} \Delta w_\lambda + c(x, \lambda)w_\lambda = 0 & \text{in } \Sigma_\lambda \\ w_\lambda \leq 0 \quad \text{and } w_\lambda \neq 0 & \text{on } \partial\Sigma_\lambda \end{cases}$$

If  $\lambda$  is close to  $a$ , and noting that  $u$  can not be identically be a constant, the *maximum principle in narrow domain* implies  $w_\lambda < 0$  in  $\Sigma_\lambda$ . Set  $\lambda_0$  to be the infimum of  $\lambda \in (0, a)$  such that  $w_\lambda < 0$  in  $\Sigma_\lambda$ .

We will argue by contradiction to show such  $\lambda_0$  can not be positive. If  $\lambda_0 > 0$ , then by continuity of  $w_\lambda$ , we have  $w_{\lambda_0} \leq 0$  in  $\Sigma_{\lambda_0}$  and  $w_{\lambda_0} = 0$  on  $\partial\Sigma_{\lambda_0}$ . *Strong maximum principle* now gives  $w_{\lambda_0} < 0$  in  $\Sigma_{\lambda_0}$ . Let  $\epsilon > 0$  be arbitrary. Fix  $\delta > 0$  (to be chosen later). Let  $K$  be a closed subset in  $\Sigma_{\lambda_0}$  so that  $|\Sigma_{\lambda_0} \setminus K| < \delta/2$  and for some  $\eta > 0$ ,

$$w_{\lambda_0}(x) \leq -\eta < 0 \quad \forall x \in K.$$

By continuity again,  $w_{\lambda_0-\epsilon} < 0$  in  $K$  and we also find that, by assumptions on  $u$  (0 on boundary and positive in the interior of  $\Omega$ ) we have  $w_{\lambda_0-\epsilon}(x) \leq 0$  on  $\partial\Sigma_{\lambda_0-\epsilon}$  - hence together,  $w_{\lambda_0-\epsilon} \leq 0$  on  $\partial(\Sigma_{\lambda_0-\epsilon} \setminus K)$ . For  $\epsilon > 0$  small enough,

$$|\Sigma_{\lambda_0-\epsilon} \setminus K| < \delta$$

is also small. Apply *maximum principle for narrow domains* on  $\Sigma_{\lambda_0-\epsilon}$ , then  $w_{\lambda_0-\epsilon}(x) \leq 0$  in  $\Sigma_{\lambda_0-\epsilon} \setminus K$ . Now by the *Serrin comparison principle*, since  $w_{\lambda_0-\epsilon}$  is strictly negative in  $K$ , we have  $w_{\lambda_0-\epsilon} < 0$  in  $\Sigma_{\lambda_0-\epsilon}$ . Thi is a contradiction to the minimality of  $\lambda_0$ . Therefore,  $\lambda_0$  should be 0.

The statement about the derivative comes from the fact that  $u(x_1, y)$  is decreasing in  $x_1$  for any  $(x_1, y) \in \Sigma_0$ .

(End of proof)  $\square$

(26th February, Tuesday)

We have seen in the last lecture how we can find solution for  $-\Delta u = f(u)$  using  $C^{2,\alpha}$  Schauder estimates (potential theory).

One famous example of equations of such type is prescribed curvature equation. That is, for a Riemannian surface  $(M, g)$ , it solves

$$\operatorname{div}\left(\frac{\nabla u}{\sqrt{1 + |\nabla u|^2}}\right) = H(u), \quad \det(D^2 y) = F(\kappa, u) = \tilde{F}(x, u, \nabla u)$$

for curvatures  $\kappa, H$  and with coefficients in the linear regime may be measurable (say  $L^p$ ).

**Goal :** to develop a regularity theory for *weak solutions*.

Let  $L$  be an operator of form

$$L = - \sum_{i=1}^d \partial_{x_i} (a^{ij}(x) \partial_{x_j} u) + c(x) \quad (\text{so that } b^i \equiv 0)$$

and consider equation  $Lu = f$  in  $\Omega$ . We impose conditions

$$\left\{ \begin{array}{l} a^{ij} \in L^\infty \cap C^0(\Omega), \\ a^{ij} = a^{ji} \\ a^{ij}(\xi) \xi_i \xi_j \geq \lambda |\xi|^2, \quad \forall \xi \in \mathbb{R}^d \\ f \in L^{\frac{2d}{d+2}}(\Omega) \quad (\text{exponent chosen for Sobolev embedding}) \end{array} \right.$$

$u$  is a weak solution of  $Lu = f$  if

$$\int_{\Omega} \left( \sum_{i,j=1}^n a^{ij}(x) \partial_{x_j} u \partial_{x_i} \varphi + cu \varphi \right) dx = \int_{\Omega} \varphi f dx, \quad \forall \varphi \in H_0^1(\Omega)$$

We want to characterize Hölder continuity in terms of the growth of local integrals.

Let  $\Omega \subset \mathbb{R}^d$  be bounded and connected. Given  $u \in L_{loc}^1(\Omega)$ , given  $x_0 \in \Omega$ ,  $r > 0$  such that  $B(x_0, r) \subset \Omega$ , we define

$$u_{x_0, r} = \frac{1}{|B(x_0, r)|} \int_{B(x_0, r)} u(x) dx$$

**Theorem)** Assume that  $u \in L^2(\Omega)$  and there are  $M > 0$ ,  $\alpha \in (0, 1)$ .

$$\int_{B(x_0, r)} |u(x) - u_{x_0, r}|^2 dx \leq M^2 r^{d+2\alpha}, \quad \forall B(x_0, r) \subset \Omega$$

Then  $u$  has continuous correction in  $C^{0, \alpha}(\Omega)$  and  $\forall \overline{\Omega'} \subset \Omega$ , we have

$$|u|_{0, \alpha, \Omega'} \leq C(M + \|u\|_{L^2(\Omega)})$$

for some  $C = C(d, \alpha, \Omega, \Omega') > 0$ .

**proof)** Let  $R_0 = \text{dist}(\Omega', \partial\Omega) > 0$ . Let  $0 < r_1 < r_2 \leq R_0$ . Then

$$\begin{aligned} |u_{x_0, r_1} - u_{x_0, r_2}|^2 &= \left| \frac{1}{|B(x_0, r_1)|} \int_{B(x_0, r_1)} u(y) dy - \frac{1}{|B(x_0, r_2)|} \int_{B(x_0, r_2)} u(y) dy \right|^2 \\ &\leq 2|u(x) - u_{x_0, r_1}|^2 + 2|u(x) - u_{x_0, r_2}|^2 \end{aligned}$$

Integrate on  $B(x_0, r_1)$ ,

$$\begin{aligned} |B(x_0, r_1)| |u_{x_0, r_1} - u_{x_0, r_2}|^2 &\leq 2 \int_{B(x_0, r_1)} |u(x) - u_{x_0, r_1}|^2 dx + 2 \int_{B(x_0, r_2)} |u(x) - u_{x_0, r_2}|^2 dx \\ &\leq 2M^2 r_1^{d+2\alpha} + 2M^2 r_2^{d+2\alpha} \end{aligned}$$

so

$$|u_{x_0, r_1} - u_{x_0, r_2}|^2 \leq \frac{M^2 c(d)}{r_1^d} (r_1^{d+2\alpha} + r_2^{d+2\alpha})$$

We want  $r_1, r_2 \rightarrow 0$ . Take  $R \leq R_0$ ,  $r_{1,j} = \frac{R}{2^{j+1}}$ ,  $r_{2,j} = \frac{R}{2^j}$ ,  $j \in \mathbb{N}$ . Then

$$|u_{x_0, R2^{-j-1}} - u_{x_0, R2^{-j}}| \leq c(d) \frac{MR_0^\alpha}{2^{j\alpha}}$$

So we have proved that  $(u_{x_0, 2^{-k}R})_{k \in \mathbb{N}}$  is a Cauchy sequence in  $\mathbb{R}$ . So we may set  $\hat{u}(x_0) = \lim_{k \rightarrow \infty} u_{x_0, 2^{-k}R}$  and moreover  $u_{x_0, r}$  converges to  $u(x_0)$  with a uniform bound (that does not depend on  $x_0$ )

$$|u_{x_0, r} - \hat{u}(x_0)| \leq c(d, \alpha)Mr^\alpha \quad \dots\dots\dots (\otimes)$$

Now by *Lebesgue's differentiation theorem*,  $\lim_{r \rightarrow 0^+} \int_{B(x_0, r)} \frac{u(x)}{|B(x_0, r)|} dx = u(x_0, r)$  for a.e.  $x_0$ , whenever  $u \in L^1_{loc}(\Omega) \subset L^2(\Omega)$  so  $\hat{u} = u$  a.e. in  $\Omega$ . But  $\hat{u}$  is continuous because it is a uniform limit of continuous functions. Hence  $u$  is also continuous (has continuous correction) at  $x_0$ .

Next, we prove that  $u$  is bounded in  $\Omega$  with estimates. Observe that

$$|u_{x, r} - u(y, r)| = \frac{1}{|B(x, r)|} \left| \int_{B(x, r)} u(\xi) d\xi - \int_{B(y, r)} u(\xi) d\xi \right| \rightarrow 0$$

as  $|x - y| \rightarrow 0$ . Also by  $(\otimes)_i$

$$\begin{aligned} |u(x_0)| &\leq CMR^\alpha + |u_{x, R}| \quad \forall x_0 \in \Omega', \forall R \leq R_0 \\ \Rightarrow |u|_{0, \Omega'} &\leq MR_0^\alpha + \|u\|_{L^2(\Omega)} \quad \dots\dots\dots (\oplus) \end{aligned}$$

where we have second line since

$$|u_{x, R}| = \left| \frac{1}{|B(x, R)|} \int_{B(x, R)} u(\xi) d\xi \right| \leq \frac{1}{|B(x, R)|} \left( \int_{B(x, R)} dx \right)^{1/2} \left( \int_{B(x, R)} |u(\xi)|^2 d\xi \right)^{1/2}$$

We now prove that  $u \in C^{0, \alpha}$  with estimates. First consider the case  $x, y \in \Omega'$ ,  $R := |x - y| < R_0/2$ . Then

$$\begin{aligned} |u(x) - u(y)| &\leq |u(x) - u_{x_0, 2R}| + |u(y) - u_{y, 2R}| + |u_{x, 2R} - u_{y, 2R}| \\ &\leq 2c(d, \alpha)MR^\alpha + |u_{x, 2R} - u_{y, 2R}| \end{aligned}$$

using the bound  $|u_{x_0, r} - u(x_0)| \leq c(d, \alpha)R^\alpha M$ . We now need to estimate  $|u_{x, 2R} - u_{y, 2R}|$ . First, write

$$|u_{x, 2R} - u_{y, 2R}| \leq |u_{x, 2R} - u(\zeta)| + |u_{y, 2R} - u(\zeta)|$$

Integrating over  $\zeta$ ,

$$|u_{x, 2R} - u_{y, 2R}| \leq \frac{1}{|B(x, 2R)|} \left( \int_{B(x, 2R)} |u(\zeta) - u_{x, 2R}|^2 d\zeta + \int_{B(y, 2R)} |u(\zeta) - u_{y, 2R}|^2 d\zeta \right) \lesssim M^2 R^{2\alpha}$$

So we see that, for  $R$  chosen sufficiently small,

$$|u(x) - u(y)| \leq 2c(d, \alpha)MR^\alpha \leq C_d M |x - y|^\alpha$$

If  $|x - y| > R_0/2$ , we have by  $(\oplus)$

$$\begin{aligned} |u(x) - u(y)| &\leq 2 \sup_{\Omega'} |u| \leq C \left( M + \frac{\|u\|_{L^2\Omega}}{R_0^\alpha} \right) R_0^\alpha \\ &\leq 2^\alpha C \left( M + \frac{\|u\|_{L^2(\Omega)}}{(R_2/2)^\alpha} \right) |x - y|^\alpha \end{aligned}$$

(End of proof)  $\square$

(28th February, Thursday)

Weak solutions  $u \in H^1(\Omega)$  of  $Lu = f$  satisfy

$$\sum_{i,j=1}^d \int_{\Omega} a^{ij}(x) \partial_{x_i} u \partial_{x_j} \varphi dx + \int_{\Omega} c(x) u \varphi dx = \int_{\Omega} f \varphi dx \quad \forall \varphi \in H_0^1(\Omega)$$

for  $f, c \in L^p(\Omega)$  and  $a^{ij} \in C^0(\overline{\Omega})$ . We aim to prove that

$$u \in H^1(\Omega) \cap C^{0,\alpha}(\Omega)$$

where  $H^1(\Omega)$  comes from Lax-Milgram and  $C^{0,\alpha}(\Omega)$  comes from elliptic regularity.

We had proved in the last lecture that if  $\int_{B(x_0,r)} |u(t) - u_{x_0,r}|^2 dx \leq M^2 r^{d+2\alpha}$  for all  $B(x_0, r) \subset \Omega$ , then  $u \in C^{0,\alpha}(\Omega)$  and we have estimation in  $L^2$ -norm of  $u$ . We have a simple corollary of this result :

**Corollary)** Suppose  $u \in H_{loc}^1(\Omega)$  satisfies that for some  $\alpha \in (0, 1)$ ,

$$\int_{B(x_0,r)} |\nabla u|^2 dx \leq M^2 r^{d-2+2\alpha}, \quad \forall B(x_0, r) \subset \Omega$$

Then  $u \in C^{0,\alpha}(\Omega)$  and  $\forall \Omega'$  with  $\overline{\Omega'} \subset \Omega$ ,

$$|u|_{0,\alpha,\Omega'} \leq C(M + \|u\|_{L^2(\Omega)})$$

for some  $C = C(d, \alpha, \Omega', \Omega) > 0$ .

**proof)** We use Poincaré's inequality.

$$\begin{aligned} \int_{B(x_0,r)} |u(x) - u_{x_0,r}|^2 dx &\leq C(d) r^2 \int_{B(x_0,r)} |\nabla u|^2 dx \\ &\leq C(d) r^2 M^2 r^{d-2+2\alpha} = C(d) M^2 r^{d+2\alpha} \end{aligned}$$

We conclude by applying the last proposition of the last lecture.

(End of proof)  $\square$

We expect that if  $a^{ij} \in C^0(\overline{\Omega})$ ,  $c = c(x) \in L^d(\Omega)$ ,  $f \in L^{\frac{2d}{d+2}}(\Omega)$  then the weak solution satisfies  $u \in H^1(\Omega) \cap C^{0,\alpha}(\Omega)$ .

*A priori*, we study the setting of  $\Omega$  reduced to balls. So we at the moment insist to work on  $B(0, 1) = B$ ,  $B(0, r) = B_r$ . The idea is to first assume that  $a^{ij}$  is *close* to some constant coefficient, say  $A = (a^{ij}(x_0))_{i,j=1}^d$  freezing  $a^{ij}$  to  $a^{ij}(x_0)$ . Then we will use perturbation argument.

To use perturbation argument, we may write  $u = v + w$  where  $w$  is the weak solution of  $L_0 w = 0$  where  $L_0 w := -\sum_{i,j} \partial_{x_j}(a^{ij}(x_0)\partial_{x_i} w)$  and  $v$  solves

$$\sum_{i,j=1}^d \int_B a^{ij}(x_0) \partial_{x_i} v \partial_{x_j} \varphi dx = \int_B (f\varphi - cu\varphi) dx + \sum_{i,j=1}^d \int (a^{ij}(x_0) - a^{ij}(x)) \partial_{x_i} u \partial_{x_j} \varphi dx, \quad \forall \varphi \in H_0^1(B)$$

The first step would be to study the constant-coefficient case to have control on  $w$ .

**Proposition)** Suppose that  $w \in H^1(B_R)$  is a weak solution of  $\sum_{i,j=1}^d a^{ij}(x_0) \partial_{x_i x_j}^2 u = 0$  in  $B_R$ . Then for all  $B(x_0, r) \subset B_R$  and  $\rho \in (0, r]$

$$\begin{aligned} \int_{B(x_0, \rho)} |\nabla w|^2 dx &\leq C \left(\frac{\rho}{r}\right)^d \int_{B(x_0, r)} |\nabla w|^2 dx, \\ \int_{B(x_0, \rho)} |\nabla w - (\nabla w)_{x_0, \rho}|^2 dx &\leq C \left(\frac{\rho}{r}\right)^{d+2} \int_{B(x_0, r)} \int |\nabla w - (\nabla w)_{x_0, r}|^2 dx \end{aligned}$$

To show this, we need the following inequality.

**Theorem)** (*Caccioppoli's inequality for harmonic functions*) If  $w \in C^1$  solved  $L_0 w = 0$  weakly, i.e. it satisfies  $\int_B a^{ij}(x_0) \partial_{x_i} w \partial_{x_j} \varphi dx = 0$  for all  $\varphi \in H_0^1(B)$ , then

$$\int_B |\nabla w|^2 \eta^2 dx \leq C \int_B |\nabla \eta|^2 |w|^2 dx, \quad \forall \eta \in C_0^1(B)$$

for  $C = C(\lambda, \Lambda) > 0$  where  $\lambda|\xi|^2 \leq \sum_{i,j} a^{ij}(x_0) \xi_i \xi_j \leq \Lambda|\xi|^2$ .

**proof)** Let  $\eta \in C_0^1(B)$  and choose  $\varphi := \eta^2 w$  in the weak formulation. Then, noting that  $\nabla \varphi = 2\eta(\nabla \eta)w + \eta^2 \nabla w$ ,

$$\begin{aligned} \lambda \int \eta^2 |\nabla w|^2 dx &\leq C(\lambda, \Lambda) \int_B \eta |w| |\nabla \eta| |\nabla w| dx \\ &\leq C(\lambda, \Lambda) \left( \int_B \eta^2 |\nabla w|^2 dx \right)^{1/2} \left( \int_B |\nabla \eta|^2 |w|^2 dx \right)^{1/2} \quad (\text{Cauchy-Schwarz}) \end{aligned}$$

as desired.

(End of proof)  $\square$

**Corollary)** (*Precis version of Caccioppoli's inequality*) With same choice of  $w$  as above, for all  $0 < r < R \leq 1$ ,

$$\int_{B(0, r)} |\nabla w|^2 dx \leq \frac{C}{(R-r)^2} \int_{B(0, R)} |w|^2 dx$$

[This can be thought of as a reverse of Poincaré inequality]

**proof)** Choose  $\eta \in C_0^1(B)$  such that  $\eta = 1$  on  $B(0, r)$ ,  $\eta \equiv 1$  on  $B(0, r)$  and  $\eta \equiv 0$  outside  $B(0, R)$  and such that  $|\nabla \eta| \leq \frac{2}{R-r}$ .

(End of proof)  $\square$

**Proposition)** Assume that  $w$  is a weak solution of  $\sum_{i,j=1}^d \int_B a^{ij} \partial_{x_i} w \partial_{x_j} \varphi dx$  for all  $\varphi \in H_0^1(B)$ . Then for all  $0 < \rho \leq r$ ,

$$\begin{aligned} \int_{B(0, \rho)} |w|^2 dx &\leq C \left(\frac{\rho}{r}\right)^d \int_{B(0, r)} |w|^2 dx, \\ \int_{B(0, \rho)} |w - w_{0, \rho}|^2 dx &\leq C \left(\frac{\rho}{r}\right)^{d+2} \int_{B(0, r)} |w - w_{0, r}|^2 dx \end{aligned}$$

where  $C = C(\lambda, \Lambda)$ .

**proof)** Using dilation, without loss of generality, set  $r = 1$  and  $\rho \in (0, 1/2]$ .

♣ **Claim :**  $|w|_{L^\infty(B_{1/2})}^2 + |\nabla w|_{L^\infty(B_{1/2})}^2 \leq C(\lambda, \Lambda) \int_{B_1} |w|^2 dx$ .

: first observe that if  $w$  satisfies  $L_0 w = 0$ , then  $w$  is automatically smooth (as it is only a dilation of a harmonic function) and  $\partial^\alpha w$  satisfies the same equation. So by *Caccioppoli*,

$$\int_{B(0,1/2)} |\nabla(\partial^\alpha w)|^2 dx \leq C \int |\partial^\alpha w|^2 dx \leq \dots \lesssim \int |w|^2$$

with appropriate integration domains for in between terms. So we see  $\|u\|_{H^k(B_{1/2})} \leq C(k, \lambda, \Lambda) \|w\|_{L^2(B_1)}$ . Also one may make embedding  $H^k \hookrightarrow L^\infty$  for  $k > d/2$ , with  $\|w\|_{L^\infty(B_{1/2})} \leq C' \|w\|_{H^k(B_{1/2})}$ , so we have the conclusion.

[A short derivation of embedding  $i : H^k(\Omega) \hookrightarrow L^\infty(\Omega)$  for  $k > d/2$  and  $\Omega$  bounded : For  $f \in L^\infty(\Omega)$ ,

$$\begin{aligned} |f(x)| &= \left| \frac{1}{(2\pi)^d} \int_{\mathbb{R}^d} \tilde{u}(\xi) e^{ix\xi} d\xi \right| \\ &= \left| \frac{1}{(2\pi)^d} \int_{\mathbb{R}^d} \frac{(1 + |\xi|^2)^{k/2}}{(1 + |\xi|^2)^{k/2}} \hat{u}(\xi) e^{ix\xi} d\xi \right| \\ &\leq \left( \int \frac{d\xi}{(1 + |\xi|^2)^k} \right)^{1/2} \left( \int (1 + |\xi|^2)^k |\hat{u}(\xi)|^2 d\xi \right)^{1/2} \\ &\leq C' \|u\|_{H^k(\Omega)} \end{aligned}$$

Note that the integral converges only if  $k > d/2$ .]

Having the claim,

$$\int_{B(0,\rho)} |w|^2 dx \lesssim \rho^d |w|_{L^\infty(B_{1/2})}^2 \leq C \rho^d \int_{B_1} |w|^2 dx$$

so we have the first statement. Also,

$$\begin{aligned} \int_{B(0,\rho)} |w - w_{0,\rho}|^2 dx &= \int_{B(0,\rho)} \left| w - \frac{1}{|B(0,\rho)|} \int_{B(0,\rho)} w(y) dy \right|^2 dx \\ &\leq \frac{1}{|B(0,\rho)|} \iint_{B(0,\rho) \times B(0,\rho)} |w(x) - w(y)|^2 dx dy \\ &\leq \frac{1}{|B(0,\rho)|} \iint_{B(0,\rho) \times B(0,\rho)} |2\rho|^2 |\nabla w|_{L^\infty(B_{1/2})}^2 dx \\ &\lesssim \rho^{d+2} |\nabla w|_{L^\infty(B_{1/2})}^2 \\ &\lesssim \rho^{d+2} \int_{B_1} |w|^2 dx \quad (\text{by Claim}) \end{aligned}$$

To conclude, we observe that if  $w$  satisfies  $L_0 w = 0$ , then so does  $L_0(w - w_{0,1}) = 0$ , so applying this result for  $\bar{w} = w - w_{0,1}$ , we have

$$\int_{B(0,\rho)} |w - w_{0,\rho}|^2 dx = \int_{B(0,\rho)} |\bar{w} - \bar{w}_{0,\rho}|^2 dx \lesssim \rho^{d+2} \int_{B_1} |\bar{w}|^2 dx = \rho^{d+2} \int_{B_1} |w - w_{0,1}|^2$$

(End of proof)  $\square$

---

(5th March, Tuesday)

Recall, we had

**Proposition)** Assume that  $w$  is a weak solution of  $\sum_{i,j=1}^d \int_B a^{ij} \partial_{x_i} w \partial_{x_j} \varphi dx$  for all  $\varphi \in H_0^1(B)$ . Then for all  $0 < \rho \leq r$ ,

$$\begin{aligned} \int_{B(0,\rho)} |w|^2 dx &\leq C \left(\frac{\rho}{r}\right)^d \int_{B(0,r)} |w|^2 dx, \\ \int_{B(0,\rho)} |w - w_{0,\rho}|^2 dx &\leq C \left(\frac{\rho}{r}\right)^{d+2} \int_{B(0,r)} |w - w_{0,r}|^2 dx \end{aligned}$$

where  $C = C(\lambda, \Lambda)$ .

We have a simple corollary of this.

**Corollary)** Under the previous hypothesis, we have that  $\forall u \in H^1(B(x_0, r))$  and  $\forall 0 < \rho \leq r$ , we have

$$\int_{B(x_0,\rho)} |\nabla u|^2 dx \leq C \left( \left(\frac{\rho}{r}\right)^d \int_{B(x_0,r)} |\nabla u|^2 dx + \int_{B(x_0,r)} |\nabla(u - w)|^2 dx \right)$$

**proof)** For  $v = u - w$  and  $0 < \rho \leq r$ , has

$$\begin{aligned} \int_{B_\rho(x_0)} |\nabla u|^2 dx &\leq 2 \int_{B_\rho(x_0)} |\nabla w|^2 + 2 \int_{B_\rho(x_0)} |Dv|^2 \\ &\leq C \left(\frac{\rho}{r}\right)^d \int_{B(x_0,r)} |\nabla w|^2 + 2 \int_{B_r(x_0)} |Dv|^2 dx \\ &\leq C \left( \left(\frac{\rho}{r}\right)^d \int_{B(x_0,r)} |\nabla u|^2 dx + \int_{B(x_0,r)} |\nabla v|^2 \right) \end{aligned}$$

(End of proof)  $\square$

**Theorem)** Let  $u \in H^1(B)$  be a weak solution of  $Lu = f$ .

$$\int_B \sum_{i,j=1}^d a^{ij}(x) \partial_{x_i} u \partial_{x_j} \varphi dx + \int_B c(x) u \varphi dx = \int_B f \varphi dx, \quad \forall \varphi \in H_0^1(B)$$

with  $a^{ij} = a^{ji}$ ,  $a^{ij} \in C^0(\overline{B})$ ,  $c \in L^d(B)$ ,  $f \in L^q$ ,  $q \in (\frac{2}{d}, d)$  and  $d \geq 2$ . Then

$$\int_{B(x,r)} |\nabla u|^2 dx \leq C r^{d-2+2\alpha} \left( \|f\|_{L^q(B_1)}^2 + \|u\|_{H^1}^2 \right)$$

with  $\alpha = 2 - \frac{d}{q} \in (0, 1)$  and  $C \equiv C(\lambda, \Lambda, \|c\|_{L^d(B)}, \tau) > 0$  where  $\tau : \mathbb{R}_+ \rightarrow \mathbb{R}_+ \cup \{0\}$  sufficiently chosen so that

$$|a^{ij}(x) - a^{ij}(y)| \leq \tau(|x - y|), \quad \forall x, y \in B$$

(End of statement)  $\square$

Assume that the weak solution  $u$  exists. Last lecture, we took  $x_0 \in B$ ,  $B(x_0, r) \subset B$  and made decomposition  $u = v + w$  where  $w$  is the weak solution of  $L_0 u = 0$ . Then  $v$  must satisfy

$$\begin{aligned} \sum_{i,j=1}^d \int_B a^{ij}(x_0) \partial_{x_i} v \partial_{x_j} \varphi dx &= \int_B f \varphi dx - \int_B c(x) u \varphi dx \\ &+ \sum_{i,j=1}^d \int_B (a^{ij}(x_0) - a^{ij}(x)) \partial_{x_i} u \cdot \partial_{x_j} \varphi dx \quad \forall \varphi \in H_0^1(B) \quad \dots\dots\dots (WF_v) \end{aligned}$$

**proof of Theorem)** Take  $\varphi = v \in H_0^1(B)$  in  $(WF_v)$ . Then

$$\sum_{i,j=1}^d \int a^{ij}(x_0) \partial_{x_i} v \cdot \partial_{x_j} v dx = \int f v dx + \int c u v dx + \int \sum (a^{ij}(x_0) - a^{ij}(x)) \partial_{x_i} u \cdot \partial_{x_j} v dx$$

Using ellipticity,

$$\int_{B(x_0, \rho)} |\nabla v|^2 dx \leq C(\lambda, \Lambda, d) \int |f v| dx + \int |c u v| dx + \int \tau(|x - x_0|) |\nabla u| |\nabla v| dx$$

A sensible way to bound this is to separate out terms in  $v$  and use Sobolev embedding  $H^1 \hookrightarrow L^{\frac{2d}{d-2}}$ ,  $\|g\|_{L^{2d/(d-2)}} \leq C \|\nabla g\|_{L^2}$ , so we will keep the power of  $|v|$  to be  $\frac{2d}{d-2}$ . To estimate the first term, use *Hölder inequality* to see that

$$\int_{B(x_0, \rho)} |f v| dx \leq \left( \int |f|^{\frac{2d}{d+2}} dx \right)^{\frac{d+2}{2d}} \left( \int |v|^{\frac{2d}{d-2}} dx \right)^{\frac{d-2}{2d}}$$

For the second term,

$$\begin{aligned} \int |c u v| dx &\leq \left( \int |c u|^{\frac{2d}{d+2}} dx \right)^{\frac{d+2}{2d}} \left( \int |v|^{\frac{2d}{d-2}} dx \right)^{\frac{d-2}{2d}} \\ \int |c u|^{\frac{2d}{d+2}} dx &\leq \left( \int |c|^d dx \right)^{\frac{2}{d+2}} \left( \int |u|^2 dx \right)^{\frac{d}{d+2}} \end{aligned}$$

Hence, using Young's inequality and Sobolev embedding, with  $\theta^{\frac{d-2}{2d}} = 1$ ,

$$\begin{aligned} \int_{B(x_0, \rho)} |\nabla v|^2 dx &\leq \frac{1}{\epsilon} \left( \int |f|^{\frac{2d}{d+2}} dx \right)^{\frac{d+2}{d}} + \epsilon \int_{B(x_0, \rho)} |\nabla v|^2 dx \\ &\quad + C_\epsilon \left( \int |c|^d dx \right)^{\frac{d+2}{d}} \int_{B(x_0, \rho)} |u|^2 dx + C_\epsilon \cdot \tau^2(r) \int |\nabla u|^2 dx + \epsilon \int |\nabla v|^2 dx \end{aligned}$$

so

$$\int |\nabla v|^2 dx \lesssim \left( \int |f|^{\frac{2d}{d+2}} dx \right)^{\frac{d+2}{d}} + \left( \int |c|^d dx \right)^{\frac{d+2}{d}} \int |u|^2 dx + C(\tau) \int_{B(x_0, \rho)} |\nabla u|^2 dx$$

Now by the corollary, has

$$\begin{aligned} \int_{B(x_0, \rho)} |\nabla u|^2 dx &\leq C \left[ \left( \frac{\rho}{r} \right)^d \int_{B(x_0, r)} |\nabla u|^2 dx + \int_{B(x_0, r)} |\nabla v|^2 dx \right] \\ &\leq C \cdot \left[ \left( \frac{\rho}{r} \right)^d + \tau^2 \right] \int_{B(x_0, r)} |\nabla u|^2 dx + \left( \int |f|^{\frac{2d}{d+2}} dx \right)^{\frac{d+2}{d}} \\ &\quad + \left( \int_{B(x_0, r)} |c|^d dx \right)^{\frac{2}{d}} \int_{B(x_0, r)} u^2 dx \end{aligned}$$

Also by *Hölder inequality*,

$$\left( \int_{B(x_0, r)} |f|^{\frac{2d}{d+2}} dx \right)^{\frac{d+2}{d}} \leq \left( \int_{B(x_0, r)} |f|^q dx \right)^{\frac{2}{q}} r^{d-2+2\alpha}$$

where  $q$  was chosen so that  $\alpha = 2 - \frac{n}{q} \in (0, 1)$ . Hence we have

$$\begin{aligned} \int_{B(x_0, \rho)} |Du|^2 &\leq C \left( \left[ \left( \frac{\rho}{r} \right)^d + \tau^2(r) \right] \int_{B(x_0, r)} |Du|^2 + r^{d-2+2\alpha} \|f\|_{L^q(B_1)}^2 \right. \\ &\quad \left. + \left( \int_{B(x_0, r)} |c|^d dx \right)^{\frac{2}{d}} \int_{B(x_0, r)} u^2 dx \right) \end{aligned}$$

To proceed, we note the following lemma :

**Lemma)**  $\phi = \phi(t)$  be a non-negative, non-decreasing function on  $[0, R]$  such that

$$\phi(\rho) \leq A \left( \left( \frac{\rho}{r} \right)^\alpha + \epsilon \right) \phi(r) + Br^\beta, \quad A, \epsilon, B > 0, \beta > \alpha$$

Then

$$\phi(r) \leq C \left( \frac{\phi(R)}{R^\gamma} r^\gamma + Br^\beta \right), \quad \text{for some } \gamma \in (\beta, \alpha)$$

[I am actually bit unsure which version of the lemma I should use. See Han & Lin for reference.]

(End of statement)  $\square$

- If in the case of  $c \equiv 0$ , application of the lemma with  $\phi(\rho) = \int_{B(x_0, \rho)} |\nabla u|^2 dx$ ,  $\beta = d - 2 + 2\alpha$ ,  $\gamma = d - 2 + 2\alpha$  gives

$$\begin{aligned} \int_{B(x_0, \rho)} |\nabla u|^2 dx &\leq C \left( \frac{\rho}{r} \right)^{d-2+2\alpha} \int_{B(x_0, R)} |\nabla u|^2 dx + C \|f\|_{L^q}^2 r^{d-2+2\alpha} \\ &\leq \tilde{C} r^{d-2+2\alpha} (\|u\|_{H^1}^2 + \|f\|_{L^q}^2) \end{aligned}$$

- If  $c \not\equiv 0$ , see example sheet #4.

(7th March, Thursday)

[This lecture is essentially a recap of the last lecture.]

Recall,

**Corollary)** Under the previous hypothesis, we have that  $\forall u \in H^1(B(x_0, r))$  and  $\forall 0 < \rho \leq r$ , we have

$$\int_{B(x_0, \rho)} |\nabla u|^2 dx \leq C \left( \left( \frac{\rho}{r} \right)^d \int_{B(x_0, r)} |\nabla u|^2 dx + \int_{B(x_0, r)} |\nabla(u - w)|^2 dx \right)$$

(End of statement)  $\square$

We were working with  $\Omega = B$ . For a general domain, we can use estimate for balls covering the domain  $B$  to get an interior estimate.

$$L = \sum a^{ij}(x) \partial_{x_i} \partial_{x_j} + c(x)$$

with  $a^{ij} \in C^0(B)$ ,  $c(x) \in L^d(B)$ , and  $u \in H^1(B)$  is the weak solution to  $Lu = f$ ,  $f \in L^q(B)$ . We want to prove

$$\int_{B(x_0, r)} |\nabla u|^2 dx \leq Cr^{d-2+2\alpha} (\|u\|_{H^1(B)}^2 + \|f\|_{L^q(B)}^2)$$

We have frozen the coefficients of  $a^{ij}$  at  $x_0$ , so  $L_0 = w$  with  $L_0 = \sum a^{ij}(x_0) \partial_{x_i} \partial_{x_j}$ , and  $v = u - w$ , so that

$$\sum \int a^{ij}(x_0) \partial_{x_i} v \partial_{x_j} \varphi dx = \int_B f \varphi dx - \int c u \varphi dx + \sum (a^{ij}(x_0) - a^{ij}(x)) \partial_{x_i} u \partial_{x_j} \varphi$$

For  $B(x_0, R) \subset B(x_0, 1)$ ,  $0 < \rho < r \leq R$ , we had, by choosing  $\varphi, v$

$$\frac{1}{4} \int_{B(x_0, \rho)} |\nabla v|^2 \leq C |\tau|^2 \int_{B(x_0, \rho)} |\nabla u|^2 dx + \left( \int |c|^d dx \right)^{2/d} \int |u|^2 dx + \left( \int |f|^{\frac{2d}{d+2}} dx \right)^{\frac{d+2}{d}}$$

Also by Holder inequality,

$$\left( \int_{B(x_0, r)} |f|^{\frac{2d}{d+2}} dx \right)^{\frac{d+2}{2}} \leq \left( \int_{B(x_0, r)} |f|^{\frac{2d}{d+2}p} dx \right)^{\frac{d+2}{dp}} \left( \int_{B(x_0, r)} dx \right)^{\frac{d+2}{d}}$$

and with choice of  $\frac{1}{q} = \frac{2d}{4-2\alpha}$  and  $\frac{1}{p} = 1 - \frac{1}{q}$ , we have

$$\left( \int_{B(x_0, r)} |f|^{\frac{2d}{d+2}} dx \right)^{\frac{d+2}{d}} \leq \left( \int_{B(x_0, r)} |f|^q dx \right)^{\frac{2}{q}} r^{d-2+2\alpha}$$

We want to control  $\int_{B(x_0, \rho)} |\nabla u|^2 dx$ . To do this, we use a corollary from last lecture, that for a fixed  $r$  and  $u \in H^1(B(x_0, r))$ ,

$$\int_{B(x_0, \rho)} |\nabla u|^2 dx \leq C \left[ \left( \frac{\rho}{r} \right)^d \int_{B(x_0, r)} |\nabla u|^2 dx + \int_{B(x_0, r)} |\nabla(u-w)|^2 dx \right]$$

for all  $0 < \rho < r$ , hence

$$\int_{B(x_0, \rho)} |\nabla u|^2 dx \leq C \left( \left( \frac{\rho}{r} \right)^2 + \tau^2(r) \right) \int_{B(x_0, r)} |\nabla u|^2 dx + \|f\|_{L^q}^2 r^{d-2+2\alpha} + \|c\|_{L^d}^2 \int |u|^2 dx$$

To get the conclusion of the theorem, we want to “replace”  $r$  by  $\rho$  in the RHS, using the following lemma.

**Lemma)** Let  $\phi(t)$  be a non-negative and non-decreasing function on  $[0, R]$  and we assume that

$$\phi(\rho) \leq A \left[ \left( \frac{\rho}{r} \right)^\alpha + \epsilon \right] \phi(r) + Br^\beta$$

for some  $A, B, \alpha, \beta, \epsilon \geq 0$  with  $\beta < \alpha$  and for all  $0 < \rho \leq r < R$ . Then for any  $\gamma \in (\beta, \alpha)$ , there exists  $\epsilon_0 = \epsilon_0(A, \alpha, \beta, r)$  such that if  $\epsilon < \epsilon_0$ , we have

$$\phi(\rho) \leq C \left( \frac{\rho}{r} \right)^\gamma \phi(r) + B\rho^\beta, \quad 0 < \rho \leq r \leq R$$

[I am actually bit unsure which version of the lemma I should use. See Han & Lin for reference.]

[Note : This lemma is extremely useless. It only occurs in this context.]

(End of statement)  $\square$

- If in the case of  $c \equiv 0$ , application of the lemma with  $\phi(\rho) = \int_{B(x_0, \rho)} |\nabla u|^2 dx$ ,  $\beta = d - 2 + 2\alpha$ ,  $\gamma = d - 2 + 2\alpha$  gives

$$\begin{aligned} \int_{B(x_0, \rho)} |\nabla u|^2 dx &\leq C \left( \frac{\rho}{r} \right)^{d-2+2\alpha} \int_{B(x_0, R)} |\nabla u|^2 dx + C \|f\|_{L^q}^2 r^{d-2+2\alpha} \\ &\leq \tilde{C} r^{d-2+2\alpha} (\|u\|_{H^1}^2 + \|f\|_{L^q}^2) \end{aligned}$$

- Will see the case  $c \not\equiv 0$  in the fourth Example sheet.

---

(9th March, Saturday)

## De Giorgi's Theorem, Part I

Let  $B = B(0, 1)$ . Let  $L = \sum a^{ij}(x)\partial_{ij} + c(x)$  (so that  $b = 0$ ) with  $\lambda$ -uniformly elliptic,  $a^{ij} \in L^\infty(B)$  (not even continuous) and  $c \in L^q(B)$  for  $q > d/2$ .

**Definition** (*weak subsolution*) Let  $u \in H^1(B)$  is a **weak subsolution** of  $Lu = f$ , for  $f$  given, if

$$\sum_{i,j=1}^d \int_B a^{ij}(x) \partial_{x_i} u \partial_{x_j} \varphi dx + \int_B c(x) u \varphi dx \leq \int_B f \varphi dx$$

for any  $\varphi \in H_0^1(B)$  such that  $\varphi \geq 0$  in  $B = B(0, 1)$ .

**Theorem** (*De Giorgi, part I*) Under the previous hypothesis, assume in addition that  $f \in L^q(B)$ ,  $q > d/2$  and  $\exists \Lambda > 0$  such that

$$\sup_{i,j} |a^{ij}|_{L^\infty(B)} + \|c\|_{L^q} \leq \Lambda$$

Then, if  $u \in H^1(B)$  is a *weak subsolution* of  $Lu = f$ , then

$$u^+ \in L_{loc}^\infty(B) \quad \text{and} \quad \sup_{B(0,1/2)} u^+ \leq C(\|u^+\|_{L^2(B)}^2 + \|f\|_{L^q(B)}^2)$$

[The same bound was proved by Nash, with a method to which applies also to parabolic equations. But De Giorgi's method gives better insight.]

**proof** (*De Giorgi, 1957*) **Idea** : Choose a suitable  $\varphi$ . Let

$$u \in L^\infty(B(0, 1/2)), \quad (u - k)^+ = v \quad \int_{B(0,1/2)} (u - k)^2 dx = 0$$

with  $k$  large enough.

Take for given  $k \in \mathbb{R}_{(>0)}$ , and let  $v := (u - k)^+$ . Let  $\zeta \in C_0^1(B)$ ,  $0 \leq \zeta \leq 1$  and put  $\varphi = v\zeta^2 \geq 0$ . Inject  $\varphi = v\zeta^2$  in the weak formulation, with " $f = \int_{u>k}$ " (in this set, would have  $u = v + k$  and  $\nabla u = \nabla v$  a.e., and if  $u < k$ , any derivative of  $v$  vanishes.) Exploiting that  $\partial(v\zeta^2) = (\partial v)\zeta^2 + 2v\zeta\partial\zeta$ , we have

$$\begin{aligned} \sum_{i,j=1}^d \int a^{ij} \partial_{x_i} u \partial_{x_j} (v\zeta^2) dx &\geq \sum_{i,j=1}^d \int a^{ij} \partial_{x_i} v \partial_{x_j} v dx - 2\Lambda \int |\nabla v| |v| |\zeta| |\nabla \zeta| dx \\ &\geq \lambda \int |\nabla v|^2 \zeta^2 dx - 2\Lambda \int |\nabla v| |v| |\zeta| |\nabla \zeta| dx \end{aligned}$$

Injection of this expression in the weak formulation yields

$$\lambda \int |\nabla v|^2 \zeta^2 dx \leq \int |c| |u| v \zeta^2 dx + \int |f| v \zeta^2 dx + C_\Lambda \int |v|^2 |\nabla \zeta|^2 dx$$

where we have used  $\int |\nabla v| |v| |\zeta| |\nabla \zeta| dx \leq \frac{C_{\Lambda,\lambda}}{2} \int |\nabla \zeta|^2 |v|^2 + \frac{\lambda}{2} \int |\nabla v|^2 \zeta^2$ . Therefore,

$$\begin{aligned} \int |(\nabla v)\zeta|^2 &\lesssim \int |c| v^2 \zeta^2 dx + k \int |c| \zeta^2 v dx + \int |f| v \zeta^2 + C_\Lambda \int |\nabla \zeta|^2 v^2 dx \\ &\lesssim \int |c| v^2 \zeta^2 dx + k^2 \int_{\{v\zeta \neq 0\}} |c| \zeta^2 dx + \int |f| v \zeta^2 dx + C_\Lambda \int |\nabla \zeta|^2 v^2 dx \quad \dots\dots\dots (*) \end{aligned}$$

just using Young's inequality. [The integration domain  $\{v\zeta \neq 0\}$  looks strange, but it would be useful in a while.] The goal is to refine this bound.

At this point, recall the Sobolev embedding

$$\left( \int |v\zeta|^{\frac{2d}{d-2}} dx \right)^{\frac{d-2}{2d}} \leq C_d \left( \int |\nabla(u\zeta)|^2 dx \right)^{1/2}$$

As in the usual discussions, using Hölder inequality multiple number of times to bound the inequality above in terms of  $\|v\zeta\|_{L^{\frac{2d}{d-2}}}$  along with Sobolev inequality would give the desired estimate. (Will be doing this in a moment.)

Using *Hölder inequality*, get

$$\begin{aligned} \int |f|v\zeta^2 dx &\leq \left( \int |f|^q dx \right)^{1/q} \left( \int |v\zeta|^{q'} |\zeta|^{q'} dx \right)^{1/q'} \\ &\leq \|f\|_{L^q} \left( \int |v\zeta|^{q'p} dx \right)^{\frac{1}{pq'}} \left( \int |\zeta|^{q'p'} dx \right)^{1/p'q'} \end{aligned}$$

with  $\frac{1}{p} + \frac{1}{p'} = \frac{1}{q} + \frac{1}{q'} = 1$ , and  $q$  is as given in the statement of the theorem. We want  $q'p = \frac{2d}{d-2}$  so that  $\frac{1}{p'q'} = \frac{1}{q'}(1 - \frac{1}{p}) = \frac{1}{q'} - \frac{2d}{d-2} = 1 - \frac{1}{q} - \frac{d-2}{2d} =: \frac{1}{\theta}$ , so

$$\int |f|v\zeta^2 dx \leq \|f\|_{L^q} \left( \int |v\zeta|^{\frac{2d}{d-2}} dx \right)^{\frac{d-2}{2d}} \left( \int_{\{\zeta v \neq 0\}} |\zeta|^\theta dx \right)^{1/\theta}$$

Key idea : it seems dealing with  $\|\zeta\|_{L^\theta}$  is difficult. However, noting that  $|\zeta| < 1$ , then  $\left( \int_{\{\zeta v \neq 0\}} |\zeta|^\theta dx \right)^{1/\theta} \leq \text{meas}(\{\zeta v \neq 0\})^{1/\theta}$ . Also, by Sobolev embedding, has  $\left( \int |v\zeta|^{\frac{2d}{d-2}} dx \right)^{\frac{d-2}{2d}} \leq \|\nabla(v\zeta)\|_{L^2}$ . So by Young's inequality,

$$\begin{aligned} \int |f|v\zeta^2 dx &\leq C_\delta \|f\|_{L^q}^2 \text{meas}(\{\zeta v \neq 0\})^{2/\theta} + \delta \int |\nabla(v\zeta)|^2 dx \\ &= C_\delta \|f\|_{L^q}^2 \text{meas}(\{\zeta v \neq 0\})^{1+\frac{2}{d}-\frac{2}{q}} + \delta \int |\nabla(u\zeta)|^2 dx \end{aligned}$$

for some  $C_\delta$ .

**Claim :** if  $\text{meas}(\{\zeta v \neq 0\})$  is small, then the terms in (\*) involving  $c$  can be absorbed by the others.

: Using *Hölder* again,

$$\begin{aligned} \int |c|v^2\zeta^2 dx &\leq \left( \int |c|^q dx \right)^{1/q} \left( \int_{\{v\zeta \neq 0\}} (v\zeta)^{2q'} dx \right)^{1/q'} \\ &\leq \|c\|_{L^q} \left( \int |v\zeta|^{\frac{2d}{d-2}} dx \right)^{\frac{d-2}{d}} \text{meas}(\{v\zeta \neq 0\})^{1-\frac{d-2}{d}-\frac{1}{q}} \\ &\leq \delta \|c\|_{L^q}^2 \int |\nabla(\zeta v)|^2 dx + C_\delta \cdot \text{meas}(\{v\zeta \neq 0\})^{\frac{2}{d}-\frac{1}{q}} \end{aligned}$$

Recalling  $\|c\|_{L^q} \leq \Lambda$ , we can choose  $\delta > 0$  such that  $\delta \cdot \Lambda < 1/100$ .

The term  $k^2 \int_{\{v\zeta \neq 0\}} |c|\zeta^2$  is bounded by

$$k^2 \int_{\{v\zeta \neq 0\}} |c|\zeta^2 dx \leq k^2 \|c\|_{L^q} \text{meas}(\{v\zeta \neq 0\})^{1-\frac{1}{q}}$$

Also note that  $\text{meas}(\{v\zeta \neq 0\})^{\frac{2}{d}-\frac{1}{q}}$  may be absorbed in  $\text{meas}(\{v\zeta \neq 0\})^{1-\frac{1}{q}}$  whenever  $\text{meas}(\{v\zeta \neq 0\})$  is small.

Using the claim, we would have (\*) with  $c$  eliminated and in written terms of  $\text{meas}(\{v\zeta \neq 0\})$ ,

$$\int |\nabla(\zeta v)|^2 dx \leq C \left( \int v^2 |\nabla \zeta|^2 dx + (\|f\|_{L^q}^2 + k^2) \text{meas}(\{v\zeta \neq 0\})^{1-\frac{1}{q}} \right) \dots\dots\dots (**)$$

Using Hölder inequality and Sobolev embedding, has

$$\int (v\zeta)^2 dx \leq \|v\zeta\|_{L^{\frac{2d}{d-2}}}^2 \text{meas}(\{v\zeta \neq 0\})^{\frac{2}{d}} \leq C_d \int |\nabla(v\zeta)|^2 dx \cdot \text{meas}(\{v\zeta \neq 0\})^{\frac{2}{d}}$$

This yields, along with (\*\*),

$$\begin{aligned} \int (v\zeta)^2 dx &\leq \int |\nabla(v\zeta)|^2 dx \cdot \text{meas}(\{v\zeta \neq 0\})^{2/d} \\ &\lesssim \int |v|^2 |\nabla \zeta|^2 dx \cdot \text{meas}(\{v\zeta \neq 0\})^{2/d} + \left( \|f\|_{L^q}^2 + k^2 \right) \cdot \text{meas}(\{v\zeta \neq 0\})^{1-\frac{1}{q}+\frac{2}{d}} \end{aligned}$$

Then we have proven that  $\exists \epsilon = \frac{2}{d} - \frac{1}{q} > 0$  and  $C$  such that

$$\int (v\zeta)^2 dx \leq C \left( \int v^2 |\nabla \zeta|^2 dx \cdot \text{meas}(\{v\zeta \neq 0\})^\epsilon + (k^2 + \|f\|_{L^q}^2) \text{meas}(\{v\zeta \neq 0\})^{1+\epsilon} \right)$$

**Next time :** Choose  $\zeta$  with  $|\nabla \zeta| \leq (S)$ , and  $\{\zeta v \neq 0\} = \{u \geq k, |x| < r\}$ . Hence

$$\int_{\{u > k, |x| < r\}} (u - k)^2 dx \leq C(k, r)$$

Goal would be to find  $k_\infty$  large enough so that  $\int (u - k_\infty)^2 dx = 0$ . Choose  $(k_n, r_n)$  as a sequence such that

$$\int_{\{u > k_n, |x| > r_n\}} (u - k_n)^2 dx \leq \gamma(k_n, r_n)^k \int (u - k_0)^2 dx$$

(12th March, Tuesday)

We were proving,

**Theorem)** (De Giorgi, part I) Let  $L = \sum_{i,j=1}^d a^{ij}(x) \partial_{x_i} \partial_{x_j} + c(x)$ ,  $a^{ij} \in L^\infty(B)$ ,  $c \in L^q(B)$ ,  $q > \frac{d}{2}$  such that  $\sup_{ij} |a^{ij}|_{L^\infty(B)} + \|c\|_{L^q} < \Lambda$  and with usual uniform ellipticity condition.

If  $u$  is a weak subsolution of  $Lu = f$ ,  $f \in L^q(B)$ , then we have  $u^+ \in L_{loc}^\infty(B)$  and moreover

$$\sup_{B(0,1/2)} u^+ \leq C(\|u^+\|_{L^2(B)} + \|f\|_{L^q(B)})$$

where  $C = C(d, \lambda, \Lambda, q) > 0$ .

**proof continued)** Last time, we chose  $v = (u - k)^+$  and  $\varphi = v\zeta^2$  for some  $\zeta \in C_0^\infty(B)$ ,  $0 \leq \zeta \leq 1$ . The goal is to find  $k$  such that  $\int v^2 dx = 0$ . This will imply  $u^+ \leq k$ .

The key result from the last lecture is that by choosing  $\epsilon = \frac{2}{d} - \frac{1}{q} > 0$ , we have

$$\int (v\zeta)^2 dx \leq C \left( \int v^2 |\nabla \zeta|^2 dx \cdot \text{meas}(\{v\zeta \neq 0\})^\epsilon + (k + \|f\|_{L^q})^2 \text{meas}(\{v\zeta \neq 0\})^{1+\epsilon} \right) \dots\dots\dots (\dagger)$$

Now, choose  $\zeta \in C_0^\infty(B)$  with

$$\begin{cases} \zeta = 1 & \text{in } B(0, r) \\ \zeta = 0 & \text{in } B(0, 1) \setminus B(0, R) \\ |\nabla \zeta| \leq \frac{2}{R-r} & \text{in } B(0, 1) \end{cases}$$

for some  $0 < r < R < 1$ . With such choice of  $\zeta$ , we have

$$\{v\zeta \neq 0\} = A(k, r) := \{x \in B(0, r) : u \geq k\}$$

We may then recast (†) in terms of  $A(k, r)$ .

$$\int_{A(k, r)} (u - k)^2 dx \lesssim |A(k, r)|^\epsilon \frac{1}{(R - r)^2} \int_{A(k, r)} (u - k)^2 dx + (k + \|f\|_{L^q})^2 |A(k, r)|^{1+\epsilon} \quad \dots\dots\dots (\dagger')$$

whenever  $|A(k, r)|$  is small enough. We want to make some sort of bound on the RHS and use iterative scheme to make  $\int_{A(h, r)} (u - h)^2 \rightarrow 0$  for some fixed  $h$ .  $|A(h, r)|$  can be estimated as

$$\begin{aligned} |A(h, r)| &= \text{meas}(\{x \in B(0, r) : u \geq h\}) \\ &= \int_{x \in B_r, u \geq h} dx \leq \frac{1}{h} \int_{A(h, r)} u^+ dx \leq \frac{1}{h} \left( \int_{A(h, r)} (u^+)^2 dx \right)^{1/2} \left( \int_{A(h, r)} dx \right)^{1/2} \\ &= \frac{1}{h} \left( \int_{A(h, r)} (u^+)^2 dx \right) |A(h, r)|^{1/2} \\ \Rightarrow |A(h, r)| &= \frac{1}{h^2} \left( \int_{A(h, r)} (u^+)^2 dx \right) \end{aligned}$$

Take  $k_0 := C_0 \|u\|_{L^2(B)}$ , for  $C_0$  large enough so that

$$|A(k_0, r)| \leq \frac{1}{(k_0)^2} \|u^+\|_{L^2(B)} \leq \frac{1}{C_0} \ll 1$$

For any  $h > k$ , has  $A(k, r) \supset A(h, r)$ , so

$$\int_{A(h, r)} (u - h)^2 dx \leq \int_{A(k, r)} (u - h)^2 dx \leq \int_{A(k, r)} (u - k)^2 dx$$

and

$$\begin{aligned} |A(h, r)| &= \text{meas}(B(0, r) \cap \{u \geq h\}) \\ &= \int_{B(0, r), u-k \geq h-k} dx \leq \int \frac{(u - k)^2}{(h - k)^2} dx \leq \frac{1}{(h - k)^2} \int_{A(k, r)} (u - k)^2 dx \end{aligned}$$

For any choice of  $h > k \geq k_0$  and  $\frac{1}{2} \leq r < R \leq 1$ , any we apply (†') with the new estimates.

$$\begin{aligned} \text{LHS}(h, r) &:= \int_{A(h, r)} (u - h)^2 dx \\ &\lesssim \frac{|A(h, r)|^\epsilon}{(R - r)^2} \int_{A(k, r)} (u - k)^2 dx + (h + \|f\|_{L^q})^2 |A(h, r)|^{1+\epsilon} \\ &\leq \frac{1}{(R - r)^2} \frac{1}{(h - k)^{2\epsilon}} \left( \int_{A(k, r)} (u - k)^2 dx \right)^\epsilon \left( \int_{A(k, r)} (u - k)^2 dx \right) \\ &\quad + (h + \|f\|_{L^q})^2 \frac{1}{(h - k)^{2(1+\epsilon)}} \left( \int_{A(k, r)} (u - k)^2 dx \right)^{1+\epsilon} \\ &\leq \frac{1}{(h - k)^{2\epsilon}} \left( \int_{A(k, r)} (u - k)^2 dx \right)^{1+\epsilon} \left( \frac{1}{(R - r)^2} + \frac{(h + \|f\|_{L^q})^2}{(h - k)^2} \right) =: \text{RHS}(k, r, R) \quad \dots\dots\dots (\dagger'') \end{aligned}$$

Hence we have an iterative scheme :

- Let  $k_l = k_0 + k^* \left(1 - \frac{1}{2^l}\right)$ , so  $k_l \leq k_0 + k^*$ . The constant  $k^*$  would be specified later to be sufficiently large.
- Let  $r_l = \tau + \frac{1}{2^l}(1 - \tau)$  where  $\tau = \frac{1}{2}$ .
- As  $l \rightarrow \infty$ ,  $k_l \nearrow k_0 + k^*$  and  $r_l \searrow 1/2$ . Also,  $\frac{1}{2} \leq r_l \leq R < 1$  for sufficiently large  $l$  so we can apply the new estimate  $\text{LHS}(h, r_l) \leq \text{RHS}(k_l, r_l, R)$ .
- Has  $k_l - k_{l-1} = k^* \left(\frac{1}{2^{l-1}} - \frac{1}{2^l}\right) = \frac{k^*}{2^l}$  and  $r_{l-1} - r_l = \frac{1-\tau}{2^l}$ .
- We let  $\varphi(k, r) = \|(u - k)^+\|_{L^2(B(0, r))} = \left(\int_{A(k, r)} (u - k)^2 dx\right)^{1/2}$ . We apply  $(\dagger'')$ , then

$$\begin{aligned}
\varphi(k_l, r_l) &\lesssim \left(\frac{1}{(r_{l-1} - r_l)} + \frac{k_l + \|f\|_{L^q}}{k_l - k_{l-1}}\right) \frac{1}{(k_l - k_{l-1})^\epsilon} \varphi(k_{l-1}, r_{l-1})^{1+\epsilon} \\
&= \left(\frac{2^l}{1-\tau} + \frac{k_0 + k^*(1 - 1/2^l) + \|f\|_{L^q}}{k^*/2^l}\right) \frac{1}{(k^*/2^l)^\epsilon} \varphi(k_{l-1}, r_{l-1})^{1+\epsilon} \\
&= \left(\frac{2^l}{1-\tau} + \frac{2^l(k_0 + k^* + \|f\|_{L^q})}{k^*}\right) \frac{2^{l\epsilon}}{(k^*)^\epsilon} \varphi(k_{l-1}, r_{l-1})^{1+\epsilon} \\
&= \frac{k_0 + 3k^* + \|f\|_{L^q}}{(k^*)^{1+\epsilon}} 2^{l(1+\epsilon)} \varphi(k_{l-1}, r_{l-1})^{1+\epsilon} \quad \text{as } \tau = \frac{1}{2}
\end{aligned}$$

Choose  $k^* = C_\infty(k_0 + \|f\|_{L^q} + \varphi(k_0, r_0))$ , then, as  $r^\epsilon > 2^{1+\epsilon} > 1$ ,

$$\varphi(k_l, r_l) \lesssim \frac{1}{r^l} \varphi(k_0, r_0)^{1+\epsilon} \xrightarrow{l \rightarrow \infty} 0$$

Hence

$$\varphi(k_0 + k^*, 1/2) = 0$$

This implies

$$\sup_{B(0, 1/2)} u^+ \leq k_0 + k^* \leq C(\|u^+\|_{L^2(B)} + \|f\|_{L^q})$$

(End of proof)  $\square$

(14th March, Thursday)

## De Giorgi's Theorem, Part II

Set  $B = B(0, 1)$ . We now write  $Lu$  in the *divergence form*

$$Lu = \sum_{i,j=1}^d \partial_{x_i}(a^{ij}(x) \partial_{x_j} u) + c(x)$$

Here, we assume  $c = 0$ . Also let  $a^{ij} \in L^\infty(B)$ ,  $a^{ij} = a^{ji}$  and  $\lambda|\xi|^2 \leq \sum a^{ij} \xi_i \xi_j \leq \Lambda|\xi|^2$ .

**Definition** A function  $u \in H_{loc}^1(B)$  is a **(weak) subsolution** of  $Lu = 0$  if,  $\forall \varphi \in H_0^1(B)$ ,  $\varphi \geq 0$ , we have

$$\sum_{i,j=1}^d \int_B a^{ij}(x) \partial_{x_i} u \partial_{x_j} \varphi dx \leq 0$$

In *De Giorgi (part I)*, we have proved that whenever  $u$  is a weak subsolution of  $Lu = f$ ,  $f \in L^q(B)$ , then it is in  $L^\infty_{loc}(B)$  and  $\|u^+\|_{L^\infty(0, \frac{1}{2})} \leq C(\|u\|_{H^1}^2 + \|f\|_{L^q}^2)$ .

**Theorem)** (*De Giorgi, part II*) If  $u$  is a weak solution of  $Lu = 0$  in  $B(0, 1)$ , then  $u \in C^{0, \alpha}(b)$  and

$$\sup_{x \in B(0, 1/2)} |u(x)| + \sup_{x, y \in B(0, 1/2)} \frac{|u(x) - u(y)|}{|x - y|^\alpha} \leq C(d, \Lambda/\lambda) \|u\|_{L^2(B)}$$

for some  $\alpha = \alpha(d, \lambda/\Lambda) \in (0, 1)$ .

We will need three key ingredients to prove the theorem.

- Poincaré-Sobolev inequality
- Density theorem
- Oscillation theorem

First, we have the following lemma.

**Lemma)** Let  $\Phi \in C_{loc}^{0,1}(\mathbb{R})$  by *convex* and  $\Phi' \geq 0$ . If  $u$  is a subsolution of  $Lu = 0$ , then we have that  $v = \Phi(u)$  is also a subsolution of  $Lu = 0$  whenever  $v \in H^1_{loc}(B)$ .

**proof)** Exercise.

*Remark :* if  $u$  is a supersolution and  $\Phi$  is concave, then  $\Phi(u)$  is a subsolution.

**Example :** if  $u$  is a subsolution, then  $v = (u - k)^+$  is also a subsolution, with choice of  $\Phi(s) = (s - k)^+$ .

**Proposition)** (*Poincaré-Sobolev inequality*) For any  $\epsilon > 0$ , there is  $C = C(\epsilon, d) > 0$  such that  $\forall u \in H^1(B)$  satisfying  $\text{meas}\{x \in B; u(x) = 0\} \geq \epsilon \cdot \text{meas}(B)$ , we have

$$\int_B |u|^2 dx \leq C(\epsilon, d) \int_B |\nabla u|^2 dx$$

**proof)** We prove by contradiction. We assume that there is a sequence  $(u_m)_m \subset H^1(B)$  satisfying the assumption and such that

$$\int_B |\nabla u_m|^2 dx \xrightarrow{m \rightarrow \infty} 0 \quad \text{while} \quad \int_B |u_m|^2 dx = 1, \quad \forall m$$

This implies  $(u_m)$  is bounded in  $H^1$ , so we have (up to a subsequence)  $u_m \rightarrow u_\infty \in H^1(B)$  strongly in  $L^2$  and weakly in  $H^1(B)$ . Then we should have  $\int |\nabla u_\infty|^2 = 0$  which implies  $u_\infty$  is a constant almost everywhere. But by the assumption  $\text{meas}\{x \in B; u(x) = 0\} \geq \epsilon \cdot \text{meas}(B)$ , we have

$$\lim_{m \rightarrow \infty} \int_B |u_m - u_\infty|^2 dx \geq \lim_{m \rightarrow \infty} \int_{u_m=0} |u_m - u_\infty|^2 dx = \int_{u_\infty=0} |u_\infty|^2 dx \geq \epsilon |u_\infty|_{L^\infty}$$

so this implies  $u_\infty$  should be identically 0, which gives a contradiction with the fact that  $u_n \rightarrow u_\infty$  in  $L^2$ .

(End of proof)  $\square$

[The difference between the original Poincaré's inequality is that we only assume  $u \in H^1(B)$  in place of  $u \in H_0^1(B)$ . There is another version of this family of inequalities : (Poincaré-Wirtinger) if  $u \in H^1(\Omega)$ , for  $\Omega$  bounded(at least in one direction) then

$$\int_{\Omega} \left| u(x) - \int_{\Omega} u(y) dy \right|^2 dx \leq C \int_{\Omega} |\nabla u|^2 dx$$

/

**Proposition)** (*Density theorem*) Suppose  $u$  is a positive supersolution of  $Lu = 0$  in  $B(0, 2)$  satisfying  $\text{meas}\{x \in B(0, 1); u(x) \geq 1\} \geq \epsilon \cdot \text{meas}(B)$ . Then there is  $C = C(\epsilon, d, \Lambda/\lambda) > 0$  such that

$$\inf_{B(0, 1/2)} u \geq C$$

Similarly, if  $u$  is a negative subsolution, then  $\sup_{B(0, 1/2)} u \leq C$ .

**proof)** Assume that  $u \geq \delta > 0$ . (We will let  $\delta \rightarrow 0^+$  later). Choosing  $\Phi(s) = (\log(s))^- = \max\{-\log(s), 0\}$ , we have  $v \leq \log \delta$  and  $v = (\log u)^-$  is a *subsolution*. As  $v$  is a subsolution, the *De Giorgi (Part I)* guarantees that

$$\sup_{B(0, 1/2)} v \leq C \left( \int_{B(0, 1)} |v|^2 dx \right)^{1/2} \quad (\text{has } f \equiv 0).$$

Also,

$$\text{meas}(\{x \in B(0, 1); v = 0\}) = \text{meas}(\{x \in B(0, 1); u \geq 1\}) \geq \epsilon \text{meas}(B)$$

By *Poincaré-Sobolev* inequality, has

$$\sup_{B(0, 1/2)} v \leq C \left( \int_B |v|^2 dx \right)^{1/2} \leq \tilde{C} \left( \int_B |\nabla v|^2 dx \right)^{1/2}$$

We want to bound the  $\int |\nabla v|^2$  part. We use the weak formulation of  $u$  being a supersolution :  $\sum \int a^{ij} \partial_{x_i} u \partial_{x_j} \varphi dx \geq 0$ . We want to choose  $\varphi$  so that  $\log u$  appear in the formulation - inject  $\varphi = \zeta^2/u$ , then

$$0 \leq \sum_{ij} \int_{B(0, 2)} a^{ij} \partial_{x_i} u \partial_{x_j} \left( \frac{\zeta^2}{u} \right) dx = - \sum \int a^{ij} \frac{\zeta^2}{u^2} \partial_{x_i} u \partial_{x_j} u dx + 2 \sum \int \frac{\zeta a^{ij} \partial_{x_i} u \partial_{x_j} \zeta}{u} dx$$

so using uniform ellipticity of  $(a^{ij})_{ij}$  and AM-GM equality, has

$$\int \zeta^2 |\nabla(\log u)|^2 dx \leq C(\Lambda/\lambda) \left( \int \frac{\zeta^2}{u^2} |\nabla u|^2 dx + \int |\nabla \zeta|^2 dx \right)$$

Fix  $\zeta \in C_0^1(B(0, 2))$  with  $\zeta = 1$  in  $B(0, 1)$ , then

$$\int_{B(0, 1)} |\nabla(\log u)|^2 dx \leq C$$

(check this) and

$$\sup_{B(0, 1/2)} v \leq \|\nabla v\|_{L^2} = \|\nabla(\log u)\|_{L^2} \leq C$$

But

$$\sup v = \sup(\log u)^- \leq C$$

so taking exponential, has  $u \geq e^{-C}$ .

To see the general case without assuming  $u \geq \delta$  for some  $\delta$ , observe that our result did not depend on  $\delta$ . Hence, if we take  $u = \lim_{\delta \rightarrow 0} \max\{u, \delta\} =: \lim_{\delta \rightarrow 0} u_\delta$  then each  $u_\delta = \max\{u, \delta\}$  is a positive supersolution to  $Lu = 0$  so  $u_\delta \geq e^{-C}$  uniformly over  $\delta > 0$ . Therefore, we would also have  $u \geq e^{-C}$ .

(End of proof)  $\square$

**Definition)** The **oscillation** of  $u$  is defined by

$$\text{osc}_\Omega(u) = \sup_\Omega u - \inf_\Omega u$$

**Proposition)** Assume that  $u$  is a bounded solution of  $Lu = 0$  in  $B(0, 2)$ , then there is  $\gamma = \gamma(d, \Lambda/\lambda) \in (0, 1)$  such that

$$\text{osc}_{B(0, 1/2)}(u) \leq \gamma \text{osc}_{B(0, 1)}(u)$$

(Not done in the lectures. Copied down from Qing Han & Fanghua Lin)

**Theorem 4.10)** (*Oscillation Theorem*) Suppose that  $u$  is a bounded solution of  $Lu = 0$  in  $B_2$ . Then there exists  $\gamma = \gamma(n, \Lambda/\lambda) \in (0, 1)$  such that

$$\text{osc}_{B_{1/2}} u \leq \gamma \text{osc}_{B_1} u$$

**proof)** We have proved local boundedness in the *De Giorgi (Part I)*. Set

$$\alpha_1 = \sup_{B_1} u \quad \text{and} \quad \beta_1 = \inf_{B_1} u$$

Consider the solution

$$\frac{u - \beta_1}{\alpha_1 - \beta_1} \quad \text{or} \quad \frac{\alpha_1 - u}{\alpha_1 - \beta_1}$$

Note the following equivalence

$$\begin{aligned} u &\geq \frac{1}{2}(\alpha_1 + \beta_1) &\Leftrightarrow &\frac{u - \beta_1}{\alpha_1 - \beta_1} \geq \frac{1}{2} \\ u &\leq \frac{1}{2}(\alpha_1 + \beta_1) &\Leftrightarrow &\frac{\alpha_1 - u}{\alpha_1 - \beta_1} \geq \frac{1}{2} \end{aligned}$$

- Case 1 : Suppose that

$$\text{meas}\left(\left\{x \in B_1 : \frac{2(u - \beta_1)}{\alpha_1 - \beta_1} \geq 1\right\}\right) \geq \frac{1}{2} \text{meas}(B_1)$$

Apply the *density theorem* to  $\frac{u - \beta_1}{\alpha_1 - \beta_1} \geq 0$  in  $B_1$ . Then we have for some  $C > 1$  that

$$\inf_{B_{1/2}} \frac{u - \beta_1}{\alpha_1 - \beta_1} \geq \frac{1}{C}$$

so  $\inf_{B_{1/2}} u \geq \beta_1 + \frac{1}{C}(\alpha_1 - \beta_1)$ .

- Case 2 : Suppose that

$$\text{meas}\left(\left\{x \in B_1 : \frac{2(\alpha_1 - u)}{\alpha_1 - \beta_1} \geq 1\right\}\right) \geq \frac{1}{2}\text{meas}(B_1)$$

Again by *density theorem*, we get  $\sup_{B_{1/2}} u \leq \alpha_1 - \frac{1}{C}(\alpha_1 - \beta_1)$  for same  $C$  as above.

Now set

$$\alpha_2 = \sup_{B_{1/2}} u \quad \text{and} \quad \beta_2 = \inf_{B_{1/2}} u$$

then  $\beta_2 \geq \beta_1$ ,  $\alpha_2 \leq \alpha_1$  and in both cases, we get

$$\alpha_2 - \beta_2 \leq (1 - \frac{1}{C})(\alpha_1 - \beta_1)$$

(End of proof)  $\square$

**Theorem 4.11)** (*De Giorgi, Part II*) Suppose  $Lu = 0$  weakly in  $B_1$ , then there holds

$$\sup_{B_{1/2}} |u(x)| + \sup_{x, y \in B_{1/2}} \frac{|u(x) - u(y)|}{|x - y|^\alpha} \leq C(d, \Lambda/\lambda) \|u\|_{L^2(B_1)}$$

**proof)** We have already made estimate in *De Giorgi (Part I)* (as  $f \equiv 0$  in this setting) that

$$\sup_{B_r} |u(x)| \leq C_I(r) \|u\|_{L^2(B_1)}$$

for any  $0 < r < 1$ , for some  $C_I(r) > 0$ . So it is now sufficient to make an estimate for the Hölder part in terms of  $\|u\|_{L^2(B_1)}$ . To make use of the oscillation estimate earlier, it is sufficient to show that

$$\frac{\text{osc}_{B_r(x_0)} u}{r^\alpha} \leq C \sup_{x \in B_R} |u(x)|$$

for any  $x_0 \in B_{1/2}$  and  $0 < r < \eta$ , some fixed  $0 < R < 1$ ,  $0 < \eta < 1$ .

To start, let  $\gamma_{1/2} \in (0, 1)$  be the parameter from *oscillation theorem* such that

$$\text{osc}_{B_{r/2}(x_0)} u \leq \gamma_{1/2} \cdot \text{osc}_{B_r(x_0)} u \quad \text{whenever } B_{2r}(x_0) \subset B_1.$$

Note that this is possible because if we scale  $B_{2r}(x_0)$  to have radius 2 and the solution  $u$  accordingly, then the parameters  $\Lambda$  and  $\lambda$  scale with the same rate, and therefore the dependence of  $\gamma$  in *oscillation theorem* on  $\Lambda/\lambda$  does not affect the result.

Fix  $R = 3/4$  and a small parameter  $\eta = 1/8$ . Now cover  $B_{1/2}$  with balls of radius  $2\eta$ , say  $B_{1/2} \subset \bigcup_{j=1}^M B_{2\eta}(\xi_j)$ ,  $\xi_j \in B_{1/2}$  for each  $j = 1, \dots, M$ . Then for each  $x_j$ , by *oscillation theorem*, there is  $\gamma_j \in (0, 1)$  such that  $\text{osc}_{B_{2\eta}(x_j)} u \leq \gamma_j \text{osc}_{B_R} u$ . Take  $\gamma' = \max_j \{\gamma_j\}$ , then we have

$$\text{osc}_{B_\eta(x)} u \leq \gamma' \text{osc}_{B_R} u \quad \forall x \in B_{1/2}$$

Now for any  $r < \eta$ , by applying *oscillation theorem* multiple times, we get that

$$\begin{aligned} \text{osc}_{B_r(x)} u &\leq (\gamma_{1/2})^{\log_{1/2}(\frac{r}{\eta/2})} \text{osc}_{B_\eta(x)} u \quad \forall x \in B_{1/2} \\ &= \left(\frac{2r}{\eta}\right)^{\frac{\log \gamma_{1/2}}{\log(1/2)}} \text{osc}_{B_\eta(x)} u \end{aligned}$$

and therefore we have the result with choice of  $\alpha = \frac{\log(1/\gamma_{1/2})}{\log 2}$ .

(End of proof)  $\square$
